## Índice de figuras

Figura 1: Número de estaciones con datos de temperatura mensual desde 1950 en el conjunto del territorio español que cumplen con la condición exigida para su utilización en la generación de las rejillas.....	17
Figura 2: Número de estaciones con datos diarios (rojo) y horarios (verde) de temperatura, así como número total (azul) de estaciones con datos de temperatura mensual empleadas para generar las rejillas en el periodo 1961-2018.....	19
Figura 3: Tanto por ciento del número de datos mensuales de temperatura descartados en el proceso automático de control de datos en el periodo 1961-2018.....	20
Figura 4: Zonas geográficas (en rojo) consideradas para la generación de las rejillas: la primera comprende el territorio peninsular español, Baleares, Ceuta y Melilla y la segunda las islas Canarias. ....	21
Figura 5: Ejemplos de mapas mensuales de temperatura media, temperatura media de las máximas y temperatura media de las mínimas (dcha.) y estaciones utilizadas para la generación de las rejillas (izda.), correspondientes a junio de 1992. ....	23
Figura 6: Descomposición de la serie de la raíz del error cuadrático medio (RMSE) de las rejillas finales de temperatura media para la España peninsular y Baleares.....	24
Figura 7: Tendencias de la raíz del error cuadrático medio (RMSE) y de la media del error absoluto (MAE) de las rejillas mensuales de temperatura media, temperatura media de las máximas y temperatura media de las mínimas correspondientes a la España peninsular, Baleares, Ceuta y Melilla. ....	25
Figura 8: Gráficas S-I ratio para la RMSE final de la temperatura media (izda.), la temperatura media de las máximas (centro) y la temperatura media de las mínimas (dcha.) correspondientes a la España peninsular, Baleares, Ceuta y Melilla.....	26
Figura 9: Mapas de valores medios anuales de temperatura media, temperatura media de las máximas y temperatura media de las mínimas para el año 1992.....	27
Figura 10: Mapas de temperatura media anual para los distintos periodos de referencia.....	28
Figura 11: Mapas de temperatura media de las máximas (arriba) y temperatura media de las mínimas (abajo) para los distintos periodos de referencia.....	29
Figura 12: Mapas de temperatura media anual para cada decenio. ....	30
Figura 13: Mapas de temperatura media anual de las máximas para cada decenio .....	31
Figura 14: Mapas de temperatura media anual de las mínimas para cada decenio.....	32
Figura 15: Mapas de anomalías de la temperatura media (arriba), temperatura media de las máximas (izda.) y temperatura media de las mínimas (dcha.) de junio de 2018 respecto del periodo de referencia 1981-2010. ....	33
Figura 16: Mapa de las estadísticas provinciales de temperatura media mensual para junio de 1992.....	35
Figura 17: Mapa de las estadísticas provinciales de temperatura media de las máximas (arriba) y de temperatura media de las mínimas (abajo) para junio de 1992. ....	36
Figura 18: Mapas de estadísticas por comunidades autónomas para junio de 1992. Temperatura media (arriba), temperatura media de las máximas (izquierda) y temperatura media de las mínimas (derecha). ....	37
Figura 19: Mapa de las estadísticas anuales provinciales de la temperatura media del año 1992. ....	39
Figura 20: Mapa de las estadísticas anuales provinciales de la temperatura media de las máximas (arriba) y de la temperatura mínima (abajo) del año 1992.....	40
Figura 21: Mapas de las medias anuales provinciales de temperatura media para los periodos de referencia considerados.....	41

Figura 22: Mapas de las medias anuales provinciales de temperatura media de las máximas (arriba) y de temperatura media de las mínimas (abajo) para los periodos de referencia considerados. ....	42
Figura 23: Mapas de estadísticas decenales provinciales de la temperatura media anual. ....	43
Figura 24: Mapas de estadísticas decenales provinciales de la temperatura media anual de las máximas. ....	44
Figura 25: Mapas de estadísticas decenales de la temperatura media anual de las mínimas. ....	45
Figura 26: Mapas de anomalías provinciales de la temperatura media (arriba), temperatura media de las máximas (izquierda) y temperatura media de las mínimas (derecha) de junio de 2018 respecto del periodo 1981-2010. ....	46
Figura 27: Temperatura media anual (arriba) y estacional (abajo) para la España peninsular y Baleares. ....	49
Figura 28: Media anual (arriba) y estacional (abajo) de la temperatura media de las máximas para la España peninsular y Baleares. ....	50
Figura 29: Media anual (arriba) y estacional (abajo) de la temperatura media de las mínimas para la España peninsular y Baleares. ....	51
Figura 30: Temperatura media anual (arriba) y estacional (abajo) para Canarias. ....	53
Figura 31: Media anual (arriba) y estacional (abajo) de la temperatura media de las máximas para Canarias. ....	54
Figura 32: Media anual (arriba) y estacional (abajo) de la temperatura media de las mínimas para Canarias. ....	55
Figura 33: Evolución de la temperatura media anual y estacional para la España peninsular, Baleares, Ceuta y Melilla según los datos en rejilla 1961-2018. ....	61
Figura 34: Evolución de la temperatura media anual y estacional de las máximas (izda.) y de las mínimas (dcha.) para la España peninsular, Baleares, Ceuta y Melilla según los datos en rejilla 1961-2018. ....	64
Figura 35: Evolución de las tendencias de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas en ventanas móviles de 30 años para la España peninsular, Baleares, Ceuta y Melilla según los datos en rejilla 1961-2018. Las líneas gruesas y finas representan tendencias significativas y no significativas al 5 %, respectivamente. ....	66
Figura 36: Evolución de la temperatura media anual y estacional para Canarias según los datos en rejilla 1961-2018. ....	67
Figura 37: Evolución de la temperatura media anual y estacional de las máximas (izda.) y de las mínimas (dcha.) para Canarias según los datos en rejilla 1961-2018. ....	69
Figura 38: Evolución de las tendencias de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas en ventanas móviles de 30 años para Canarias según los datos en rejilla (1961-2018). Las líneas gruesas y finas representan tendencias significativas y no significativas al 5 %, respectivamente. ....	71
Figura 39: Anomalías de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas para la España peninsular, Baleares, Ceuta y Melilla, a partir de los datos en rejilla (periodo de referencia 1981-2010). En las gráficas de la izquierda se representan las series anuales y sus medias móviles en 5 años, y en las de la derecha las series mensuales junto con las medias móviles de 13 meses y de 5 años. ....	73
Figura 40: Anomalías de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas para Canarias, a partir de los datos en rejilla (periodo de referencia 1981-2010). ## Índice de tablas

Tabla 1: Valores medios de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas para cada periodo de referencia, obtenidos a partir de las rejillas de la España peninsular, Baleares, Ceuta y Melilla.....	56
Tabla 2: Valores medios de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas para cada decenio, obtenidos a partir de las rejillas de la España peninsular, Baleares, Ceuta y Melilla.....	58
Tabla 3: Valores medios de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas para cada periodo de referencia, obtenidos a partir de las rejillas de Canarias.....	59
Tabla 4: Valores medios de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas para cada década, obtenidos a partir de las rejillas de Canarias.....	59
Tabla 5: Tendencias de la temperatura media para la España peninsular, Baleares, Ceuta y Melilla en el periodo 1961-2018 a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %). .....	62
Tabla 6: Tendencias de la temperatura media para la España peninsular, Baleares, Ceuta y Melilla por periodos de referencia a partir de los datos en rejilla para cada periodo de referencia (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %). .....	63
Tabla 7: Tendencias de la temperatura media de las máximas (izda.) y de las mínimas (dcha.) para la España peninsular, Baleares, Ceuta y Melilla en el periodo 1961-2018 a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %). .....	64
Tabla 8: Tendencias de la temperatura media de las máximas (arriba) y de la temperatura media de las mínimas (abajo) para la España peninsular, Baleares, Ceuta y Melilla por periodos de referencia a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %). .....	65
Tabla 9: Tendencias de la temperatura media para Canarias en el periodo 1961-2018 a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %). .....	68
Tabla 10: Tendencias de la temperatura media para Canarias por decenios a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %). .....	68
Tabla 11: Tendencias de la temperatura media de las máximas (izda.) y de las mínimas (dcha.) para Canarias en el periodo 1961-2018 a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %). .....	70
Tabla 12: Tendencias de la temperatura media de las máximas (arriba) y de la temperatura media de las mínimas (abajo) para Canarias por decenios a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %). .....	70
Tabla 13: Anomalías más cálidas/frías de la temperatura media por meses, estaciones y años registradas en la España peninsular, Baleares, Ceuta y Melilla en el periodo 1961-2018 (periodo de referencia: 1981-2010). .....	74
Tabla 14: Meses con anomalía más cálida/fría para la temperatura media de la España peninsular, Baleares, Ceuta y Melilla en el periodo 1961-2018 (periodo de referencia: 1981-2010). .....	74
Tabla 15: Anomalías más cálidas/frías de la temperatura media de las máximas por meses, estaciones y años registradas en la España peninsular, Baleares, Ceuta y Melilla en el periodo 1961-2018 (periodo de referencia: 1981-2010). .....	75
Tabla 16: Meses con anomalía más cálida/fría para la temperatura media de las máximas de la España peninsular, Baleares, Ceuta y Melilla en el periodo 1961-2018 (periodo de referencia: 1981-2010). .....	75

Tabla 17: Anomalías más cálidas/frías de la temperatura media de las mínimas por meses, estaciones y años registradas en la España peninsular, Baleares, Ceuta y Melilla en el periodo 1961-2018 (periodo de referencia: 1981-2010).....	76
Tabla 18: Meses con anomalía más cálida/fría para la temperatura media de las mínimas de la España peninsular, Baleares, Ceuta y Melilla en el periodo 1961-2018 (periodo de referencia: 1981-2010). ....	76
Tabla 19: Anomalías más cálidas/frías de la temperatura media por meses, estaciones y años registradas en Canarias en el periodo 1961-2018 (periodo de referencia: 1981-2010). ....	79
Tabla 20: Meses con anomalía más cálida/fría para la temperatura media de Canarias en el periodo 1961-2018 (periodo de referencia: 1981-2010). ....	79
Tabla 21: Anomalías más cálidas/frías de la temperatura media de las máximas por meses, estaciones y años registradas en Canarias en el periodo 1961-2018 (periodo de referencia: 1981-2010).....	80
Tabla 22: Meses con anomalía más cálida/fría para la temperatura media de las máximas de Canarias en el periodo 1961-2018 (periodo de referencia: 1981-2010).....	80
Tabla 23: Anomalías más cálidas/frías de la temperatura media de las mínimas por meses, estaciones y años registradas en Canarias en el periodo 1961-2018 (periodo de referencia: 1981-2010). ....	81
Tabla 24: Meses con anomalía más cálida/fría para la temperatura media de las mínimas de Canarias en el periodo 1961-2018 (periodo de referencia: 1981-2010).....	81

## Abreviaturas

- **AEMET**: Agencia Estatal de Meteorología
- **BDLJE**: Base de Datos de Límites Jurisdiccionales de España
- **BNDC**: Banco Nacional de Datos Climatológicos
- **CRUTEM4**: serie de datos en rejilla de anomalía temperatura del aire de superficie sobre tierra desarrollado conjuntamente por Climatic Research Unit (University of East Anglia) y Hadley Centre (UK Met Office)
- **ECA&D**: European Climate Assessment & Dataset project
- **ECMWF**: European Centre for Medium-Range Weather Forecasts
- **EEA**: European Environment Agency (Agencia Europea de Medioambiente)
- **E-OBS**: series de valores de rejilla de temperatura diarios para Europa basados en los datos de ECA&D
- **ERA5**: producto de reanálisis del ECMWF
- **ETRS89**: European Terrestrial Reference System 1989, Sistema de Referencia Terrestre Europeo 1989.
- **GIS**: Geographic Information System
- **GISSTEMP**: Goddard Institute for Space Studies Surface Temperature Analysis (GISSTEMP) proporcionado por la NASA
- **HadCRUT4**: serie de datos de temperatura global (tierra y océano) desarrollado conjuntamente por Climatic Research Unit (University of East Anglia) y Hadley Centre (UK Met Office)
- **IM**: Instituto de Meteorología de Portugal
- **IPCC**: Intergovernmental Panel on Climate Change
- **MAE**: Media del error absoluto
- **MDT**: Modelo Digital del Terreno
- **MDT200**: Modelo Digital del Terreno con paso de malla de 200 m
- **NASA**: National Aeronautics and Space Administration
- **NOAA**: National Oceanic and Atmospheric Administration
- **OMM**: Organización Meteorológica Mundial
- **REGCAN95**: Red Geodésica Nacional por Técnicas Espaciales Canarias 1995
- **RMSE**: Raíz del error cuadrático medio
- **SAGA**: System for Automated Geoscientific Analyses
- **SEATS**: Signal Extraction in ARIMA Time Series
- **S-I ratio**: Seasonal Irregular ratio
- **SIG**: Sistema de Información Geográfica
- **TMAX, TM\_MAX**: temperatura media mensual de las máximas
- **TMED**: temperatura media mensual
- **TMIN, TM\_MIN**: temperatura media mensual de las mínimas
- **TRAMO**: Time series Regression with ARIMA noise, Missing values and Outliers
- **UTM**: Universal Transverse Mercator, sistema de coordenadas universal transversal de Mercator
- **WMO**: World Meteorological Organization

## 1 Introducción y notas de la versión 2.0

La temperatura del aire es, junto con la precipitación, la principal variable climática utilizada en la descripción del clima de un lugar. Su estudio resulta fundamental tanto para conocer el clima actual como para analizar los cambios climáticos que se han producido en épocas pasadas, así como para prever posibles escenarios climáticos futuros.

El estudio de la temperatura tradicionalmente se ha realizado a partir de los datos registrados en las estaciones climatológicas, mediante el análisis de las series de datos termométricos que se obtienen a lo largo del tiempo en cada emplazamiento. Sin embargo, la rápida evolución de la informática y de la tecnología computacional experimentada desde finales del siglo XX ha facilitado el desarrollo de los sistemas de información geográfica (SIG), los cuales permiten generar conjuntos de datos en rejilla a partir de datos puntuales mediante técnicas de interpolación espacial. Actualmente, cada vez es más frecuente el uso de datos en rejilla en el análisis y la vigilancia del clima, ya que permiten integrar la información registrada en las estaciones climatológicas y proporcionan, a su vez, una estimación de las variables climáticas en lugares carentes de observaciones, facilitando el análisis espacial y la obtención de estadísticas climáticas regionales.

En el presente trabajo, dividido en dos volúmenes, se ha realizado un análisis detallado de la temperatura en el territorio español desde 1961 hasta 2018, abarcando, por tanto, un periodo de cerca de 60 años.

En el primer volumen se describe el proceso que se ha seguido en el Área de Climatología y Aplicaciones Operativas de la Agencia Estatal de Meteorología para la generación de rejillas mensuales de temperatura de alta resolución para el periodo 1961-2018 a partir de los datos termométricos almacenados en el Banco Nacional de Datos Climatológicos. Asimismo, se describen distintos productos derivados que se obtienen a partir de las rejillas: rejillas anuales, estacionales, decenales y por periodos de referencia, estadísticas por territorios, etc. Por último, se realiza un estudio de las series de temperatura que se obtienen a partir de las rejillas, incluyendo un análisis de las tendencias de temperatura observadas en España desde 1961 que pone de manifiesto el efecto del calentamiento global de las últimas décadas sobre nuestro territorio.

En el segundo volumen se describen las series de temperatura para la España peninsular y Baleares a partir de 42 estaciones que se han venido utilizando como series de referencia para el análisis y la vigilancia del clima en el Área de Climatología y Aplicaciones Operativas durante la última década. Se comparan estas series, cuyo inicio se remonta a 1965, con las series que se obtienen a partir de las rejillas mensuales descritas en el volumen primero de la publicación, y se analiza la posibilidad de utilizar las rejillas para rellenar las lagunas de las estaciones de referencia. Se propone una actualización de las series de referencia para la España peninsular, empleando las rejillas para el relleno de lagunas y alargando el periodo de las series de referencia hasta el año 1961. Finalmente, se muestra un análisis de tendencias de las nuevas series de referencia similar al realizado en el volumen uno con las series de rejillas.

En la **versión 2.0** del primer volumen se ha añadido un nuevo anexo con las tablas de temperatura media mensual y anual de la España peninsular en el periodo 1961-2018 ([ANEXO C](#)). Aunque los valores medios mensuales y anuales en la España peninsular apenas difieren de los valores medios en el conjunto de la España peninsular, Baleares, Ceuta y Melilla publicados en la versión inicial, no habiéndose observado diferencias superiores a una décima de grado en ningún caso, se ha optado por incluirlos junto con los anteriores en esta nueva versión, ya que ambos conjuntos de

datos pueden resultar relevantes en la vigilancia del clima. Asimismo, se han revisado los valores medios anuales y estacionales publicados, los cuales se calcularon a partir de los valores mensuales, para asegurar que no existan diferencias debidas al redondeo de los decimales con los valores que proporcionan las aplicaciones informáticas del Banco Nacional de Datos Climatológicos cuando rehacen los cálculos en tiempo real. Por este motivo, pueden existir pequeñas diferencias, de una décima de grado como mucho, en algunos valores medios anuales o estacionales respecto de los publicados en la versión inicial, siendo preferible utilizar los de la versión 2.0 para garantizar la coherencia con los que se obtienen al realizar consultas al banco de datos.

## 2 Elaboración de las rejillas mensuales de temperatura

La información básica fundamental para el estudio de la temperatura del aire la conforman los datos de temperatura que se registran en las redes de estaciones climatológicas. Estas redes deben ser diseñadas y mantenidas siguiendo las recomendaciones y especificaciones de la Organización Meteorológica Mundial (OMM), ya que de esta manera se garantiza que los valores medidos en estaciones localizadas en emplazamientos diferentes sean comparables entre sí (OMM, 2014)<sup>[21]</sup>. En el presente trabajo se han utilizado los datos de la red de estaciones climatológicas de la Agencia Estatal de Meteorología (AEMET) almacenados en el Banco Nacional de Datos Climatológicos (BNDC), las cuales siguen las directrices dictadas por la OMM.

Los datos termométricos registrados en cada una de las estaciones a lo largo del tiempo dan lugar a las series de temperaturas, las cuales resultan fundamentales para analizar el clima en un lugar y en un periodo de tiempo concretos. A partir de la serie de temperatura se calculan diversos estadísticos que sirven para sintetizar y describir las características del clima, como son los valores medios o normales, los valores extremos o la probabilidad de que se superen determinados umbrales de temperatura. Asimismo, las series de temperatura permiten estudiar la variabilidad estacional e interanual de la temperatura y la existencia de tendencias, análisis esenciales en los estudios sobre cambio climático.

A pesar de la importancia que tienen los datos registrados en las estaciones climatológicas para el análisis de la variabilidad temporal del clima en los lugares de medida, a menudo resultan insuficientes para analizar su variabilidad espacial debido a que proporcionan información únicamente en aquellos puntos en los que se dispone de medidas. Aunque es habitual encontrar zonas en las que la densidad de estaciones es elevada, como ocurre con frecuencia en áreas geográficas con una alta concentración de núcleos de población, en otras la información es a menudo escasa, encontrándose las estaciones de medida muy dispersas o llegando incluso a ser inexistentes. Las áreas con menor densidad de estaciones suelen coincidir con zonas de orografía compleja, en las cuales, precisamente, la temperatura suele presentar una mayor variabilidad espacial.

Estas dificultades pueden ser solventadas en parte mediante la producción de rejillas, las cuales se generan interpolando espacialmente los datos registrados en las estaciones, de forma que se obtienen valores estimados en cada uno de los puntos de la rejilla. Las técnicas de interpolación espacial avanzadas permiten incluir en el proceso variables adicionales, como la altitud, la latitud o la distancia a la costa, las cuales mejoran la estimación de la temperatura en cada punto de rejilla, minimizando así los inconvenientes derivados de una escasa densidad de observaciones.

Por otra parte, al encontrarse los puntos de rejilla distribuidos de forma regular en el espacio, se obtiene una estimación de la variable en toda la zona de estudio, facilitándose así el análisis espacial y el cálculo de estadísticos zonales derivados, como son los valores medios, máximos o mínimos en comunidades autónomas, provincias o municipios, así como el cálculo de estadísticos a nivel nacional.

Asimismo, resulta de gran utilidad disponer de rejillas históricas de temperatura para el análisis y la vigilancia del clima, ya que permiten incorporar información procedente de todas las estaciones disponibles en cada momento, incluyendo aquellas que no han tenido un funcionamiento prolongado en el tiempo.

A continuación se describe el procedimiento que se ha seguido en el Área de Climatología y Aplicaciones Operativas de la Agencia Estatal de Meteorología para la generación de rejillas

mensuales de temperatura para el periodo comprendido entre enero de 1961 y diciembre de 2018. El periodo analizado finaliza en diciembre de 2018 por tratarse del último año completo en el momento de redactar esta publicación, pero está previsto continuar generando las rejillas mensuales en tiempo cuasi real siguiendo el procedimiento descrito en la publicación. De esta forma, se prevé que estén disponibles en cada momento las series históricas mensuales de rejillas de temperatura desde 1961 hasta la fecha presente, habiéndose generado todas las rejillas que conforman las series siguiendo la misma metodología. Las rejillas generadas en tiempo cuasi real se considerarán provisionales, mientras que las que se calculen nuevamente una vez transcurridos seis meses se considerarán definitivas, ya que se trata de un plazo temporal lo suficientemente largo como para que hayan finalizado todos los procesos de adquisición de datos y control de calidad.

## 2.1 Selección de los datos de temperatura

Las variables consideradas para la generación de las rejillas fueron la temperatura media mensual de las máximas (TMAX), la temperatura media mensual de las mínimas (TMIN) y la temperatura media mensual (TMED). Se interpolaron espacialmente las variables temperatura media mensual de las máximas y temperatura media mensual de las mínimas, mientras que las rejillas de temperatura media mensual se obtuvieron de forma derivada, calculando el valor medio de las rejillas de las dos variables anteriores. De esta forma se garantiza la coherencia entre las rejillas de las tres variables.

Para la elección del periodo de estudio se hizo, en primer lugar, un análisis de los datos históricos de temperatura mensual contenidos en el Banco Nacional de Datos Climatológicos, con el objeto de prolongar todo lo posible hacia atrás la fecha de comienzo del periodo sin comprometer en exceso la calidad de las rejillas. Para considerar un dato mensual como válido se impuso la condición de que no hubiera más de dos lagunas en los valores diarios de temperatura en ese mes. En la [Figura 1](#) se ha representado el número de estaciones con datos mensuales disponibles siguiendo el criterio anterior desde 1950 en el conjunto del territorio español. No se han representado los años anteriores a 1950, en los que el número de estaciones es reducido, inferior a 400 estaciones. Se observa en la figura que durante los primeros años de la década de 1950 el número de datos es relativamente bajo, no llegando a 500 estaciones, observándose un crecimiento más o menos uniforme hasta 1965, año en el cual el número de datos se sitúa en unos 700. A partir de dicho año, el crecimiento en el número de estaciones se acelera notablemente, duplicándose el número de datos disponibles en tan solo 10 años, de forma que en 1975 hay alrededor de 1400 estaciones con datos mensuales de temperatura. Tras un ligero descenso en el número de estaciones, se observa a partir de 1983 un nuevo incremento hasta alcanzar un máximo de unas 1800 estaciones a mediados de la década de 1990. Durante el siguiente decenio el número de datos disponibles vuelve a descender ligeramente, situándose en unas 1500 estaciones en 2009. Este descenso se debe a la progresiva disminución de las estaciones termométricas de la red secundaria que se observa desde 1995, como puede apreciarse en la [Figura 2](#). A partir de 2009, aumenta nuevamente el número total de estaciones gracias al crecimiento mantenido del número de estaciones automáticas, que compensa la disminución de estaciones atendidas por colaboradores, hasta alcanzarse un número cercano a 1800 durante la segunda década del siglo XXI. Conviene recordar que estos números se refieren a las estaciones que cumplen el requisito impuesto previamente de que no existan más de dos lagunas en las temperaturas diarias del mes considerado, siendo mayor el número de estaciones que poseen datos de temperatura en el Banco Nacional de Datos Climatológicos.

*Figura 1: Número de estaciones con datos de temperatura mensual desde 1950 en el conjunto del territorio español que cumplen con la condición exigida para su utilización en la generación de las rejillas.*

Tras el análisis de los datos disponibles, se escogió enero de 1961 como fecha de comienzo del periodo para la generación de la serie histórica de rejillas por coincidir con el comienzo del periodo de referencia 1961-1990. Si bien el número de estaciones disponibles durante los primeros años no es muy elevado, este periodo ha sido establecido por la Organización Meteorológica Mundial como periodo de referencia fijo para la evaluación a largo plazo del cambio climático y de la variabilidad del clima, de forma que todos los estudios sobre cambio climático que se realicen ofrezcan resultados comparables entre sí (OMM, 2015; Chazarra et al., 2018)<sup>[22][7]</sup>, por lo que resulta especialmente relevante poder disponer de rejillas mensuales de temperatura en el territorio español desde el comienzo de este periodo.

Como se aprecia en la [Figura 1](#), el número de datos disponibles en los primeros años del periodo seleccionado, algo superior a 600, es menos de la mitad del número de datos disponibles a partir de principios de los años 70, por lo que es de esperar que las rejillas tengan una calidad inferior durante los primeros años del periodo, y que esta vaya mejorando posteriormente al aumentar el número y presumiblemente la calidad de los datos.

Los datos se obtuvieron mediante consulta directa al Banco Nacional de Datos Climatológicos realizada el 22/02/2019, salvo para los datos del año 2018, cuya consulta se realizó el 26/06/2019 para que hubieran transcurrido al menos seis meses desde la finalización del año, tiempo suficiente para garantizar que no queden datos pendientes de ser depurados.

## 2.2 Control de calidad de los datos

En el Banco Nacional de Datos Climatológicos se aplican actualmente distintos procesos de depuración de los datos registrados en la red de estaciones climatológicas, tanto de forma previa como posterior a su almacenamiento. Estos procesos han sido diseñados para garantizar la calidad de los registros climáticos almacenados en el banco de datos siguiendo las recomendaciones de la Organización Meteorológica Mundial sobre calidad de los datos (OMM, 2018)<sup>[23]</sup>. Las observaciones detectadas como dudosas en el proceso de control de calidad son analizadas por personal especializado, tras lo cual son confirmadas como válidas o bien corregidas en el banco de datos.

Dado que los procesos de depuración de datos han ido evolucionando y creciendo con los años, no se puede descartar la existencia en las series históricas de datos anómalos que no hayan sido sometidos a los controles de calidad actuales, por lo que resulta necesario añadir controles adicionales a los datos para garantizar la calidad de las rejillas históricas. Con este fin, se ha diseñado un proceso de validación automática de los datos en el que se analiza, como paso previo a la interpolación espacial de las rejillas mensuales, la coherencia espacial de los datos mensuales de cada una de las variables (temperatura media mensual, temperatura media mensual de las máximas y temperatura media mensual de las mínimas), descartándose aquellos datos que ofrecen valores significativamente diferentes a los que cabría esperar en su localización a partir de los datos vecinos. Debido al inmenso número de datos a revisar —se han generado para el periodo 1961-2018 más de 3900 rejillas, empleando para ello cerca de tres millones de datos—, este proceso se ha diseñado para ser aplicado de forma automática, habiéndose realizado diversas validaciones manuales para comprobar y calibrar el proceso automático de depuración. Este tipo de controles automáticos de calidad de los datos previos a la generación de rejillas históricas se utilizan actualmente en otros servicios meteorológicos europeos (Hollis et al., 2019)<sup>[16]</sup>.

En cuanto al método seguido, se ha adaptado el procedimiento de validación que se está empleando actualmente en el Área de Climatología y Aplicaciones Operativas para la generación de rejillas diarias de temperatura, con el fin de que exista la mayor coherencia posible entre el control de calidad de los datos diarios y el de los datos mensuales.

En la [Figura 2](#) se ha representado la evolución del número de estaciones a lo largo del periodo 1961-2018 para el conjunto del territorio español, distinguiendo entre aquellas estaciones que miden la temperatura con frecuencia horaria y las que únicamente registran la máxima y la mínima diarias. Se observa que durante los primeros años del periodo la mayoría de las observaciones son de tipo diario, siendo comparativamente escasos los registros horarios de temperatura. Sin embargo, desde mediados de los años 1990 se aprecia un marcado descenso del número de registros diarios y un aumento de los horarios, de forma que al final del periodo de estudio el número de estaciones de ambos tipos prácticamente se iguala.

Figura 2: Número de estaciones con datos diarios (rojo) y horarios (verde) de temperatura, así como número total (azul) de estaciones con datos de temperatura mensual empleadas para generar las rejillas en el periodo 1961-2018.

Esta diferencia en la forma de realizar las medidas puede afectar a la homogeneidad de los datos. En el caso de las estaciones de la red secundaria, atendidas por colaboradores, la medición suele realizarse una vez al día, generalmente por la mañana, anotándose en ese momento las temperaturas máxima y mínima observadas desde el día anterior. Si bien los valores máximo y mínimo así registrados coinciden habitualmente con las temperaturas máxima y mínima diarias ocurridas entre las 0 y las 24 h, hay casos en los que distintos fenómenos meteorológicos como advecciones de aire frío o cálido, nieblas, tormentas, etc., pueden dar lugar a que las temperaturas mínima o máxima se alcancen en horas diferentes a las habituales, con lo que la temperatura máxima o mínima asignada puede ser incorrecta o corresponder, en realidad, a un día contiguo. Estas situaciones, sin embargo, no afectan a las estaciones que registran temperatura horaria, en las cuales las temperaturas máxima y mínima se asignan siempre a la fecha correcta. Existe, por tanto, una posible fuente de error debido a la existencia de estos dos procedimientos de observación diferentes que conviene tener en cuenta en el proceso de control de datos, si bien en el caso de temperaturas medias mensuales es de esperar que los efectos sean menos evidentes que en el caso de temperaturas diarias.

Otro aspecto que conviene considerar en el control de calidad de los datos es la posibilidad de encontrar estaciones que se encuentran localizadas en emplazamientos cuyas características climáticas locales difieren sensiblemente de las de las estaciones más cercanas. Este fenómeno es relativamente habitual tanto en la península ibérica como en las islas Baleares y Canarias, al tratarse de territorios con un relieve accidentado en el que la diversidad de climas y microclimas es elevada (AEMET e IM, 2011, 2012)<sup>[1][2]</sup>. Es necesario tener en cuenta este fenómeno para evitar clasificar como erróneos datos válidos registrados en estaciones con particularidades climáticas locales. Con este fin, se distinguió entre estaciones situadas a una altitud elevada, localizadas generalmente en zonas de montaña en las que la variabilidad climática es normalmente mayor, y estaciones de baja altitud, estableciendo condiciones más rigurosas para considerar válido un valor registrado a baja altitud que en altitudes superiores. Asimismo, se seleccionó un pequeño

conjunto de estaciones fijas, situadas en emplazamientos especialmente particulares, cuyos valores se consideraron correctos independientemente del resultado de la validación automática. Entre ellas se encuentran, por ejemplo, algunas estaciones del Valle de Arán (Lleida), las cuales están situadas en la vertiente norte del Pirineo mientras que el resto de estaciones vecinas se encuentran en la vertiente sur, siendo frecuente observar un comportamiento térmico muy diferente en las estaciones de ambas vertientes debido a la presencia de nubosidad de estancamiento, lluvia, nieve o efecto Foehn únicamente en una de las vertientes, por lo que una validación automática podría catalogar un valor correcto como erróneo en esta zona. Otras zonas en las que se establecieron algunas estaciones fijas fueron las islas Baleares, las islas Canarias, el sistema Central, las sierras andaluzas, Ceuta y Melilla.

Por otra parte, dado que el control automático de calidad se realiza mediante la comparación del dato medido en cada estación con el estimado en ese punto a partir de los valores vecinos, la presencia de un dato claramente erróneo puede dar lugar a que se clasifique un dato cercano válido como erróneo, por lo que conviene ejecutar el proceso en varios pasos, de forma que se eliminen en primer lugar los datos más discordantes.

Teniendo en cuenta lo anterior, se diseñó un proceso de validación en tres pasos: en el primero se eliminan los datos discordantes asociados a las mediciones de las estaciones de tipo diario situadas en zonas de baja altitud, en el segundo los datos anómalos de estaciones de tipo diario de elevada altitud, y en el tercer paso se analizan y depuran conjuntamente todos los datos no eliminados en los pasos anteriores.

*Figura 3: Tanto por ciento del número de datos mensuales de temperatura descartados en el proceso automático de control de datos en el periodo 1961-2018.*

En la [Figura 3](#) se ha representado el tanto por ciento del número de datos descartados en el conjunto del proceso automático de control de calidad de los datos, incluyendo las tres fases. Se aprecia que el porcentaje de datos considerados como dudosos es relativamente bajo, inferior al 4 %, a lo largo de todo el periodo 1961-2018. Se observa, además, una evidente tendencia

descendente del número de datos dudosos a lo largo del periodo de estudio, quedando por debajo del 2 % en los últimos años, lo cual indica una progresiva mejora en el tiempo de la calidad de los datos termométricos almacenados en el Banco Nacional de Datos Climatológicos.

### 2.3 Generación de las rejillas y estimación de los errores

A partir del conjunto de datos que superaron el proceso de control de calidad anteriormente descrito, se procedió a la elaboración de las rejillas mensuales de temperatura media de las máximas, temperatura media de las mínimas y temperatura media. No se aplicaron procesos de homogeneización ni de relleno de lagunas a las series de datos previos a la interpolación espacial.

Se delimitaron dos zonas geográficas para la generación de las rejillas (Figura 4): la primera abarca el territorio peninsular español, las islas Baleares, Ceuta y Melilla, mientras que la segunda comprende a las islas Canarias. Se producen, por tanto, dos rejillas para cada variable y mes, correspondientes a las dos zonas geográficas consideradas.

Figura 4: Zonas geográficas (en rojo) consideradas para la generación de las rejillas: la primera comprende el territorio peninsular español, Baleares, Ceuta y Melilla y la segunda las islas Canarias.

El primer paso del proceso consiste en la interpolación espacial de las variables temperatura media mensual de las máximas y temperatura media mensual de las mínimas aplicando un modelo de regresión múltiple con la altitud, la latitud, la longitud y la distancia a la costa como variables independientes, sumando a continuación el campo de los residuos de la regresión interpolado mediante krigeado ordinario. Para el ajuste del variograma empírico se escogió un modelo exponencial con varianza en el origen igual a cero, de forma que la interpolación se realiza de forma exacta (no suavizadora). En el caso de las islas Canarias y de las islas Baleares no se incluyó la distancia al mar al no resultar significativa esta variable en el modelo de regresión. Este método es análogo al empleado en el Área de Climatología y Aplicaciones Operativas de la Agencia Estatal de Meteorología para la obtención de las rejillas normales de temperatura 1981-2010, publicadas en *Mapas climáticos de España (1981-2010) Y ETo (1996-2016)* (Chazarra et al., 2018)<sup>[6]</sup>.

Una vez generada cada rejilla, se estima el error en cada punto donde existe observación mediante validación cruzada dejando uno fuera (*leave one out cross validation*). A continuación, con los

errores estimados en cada punto de observación se calculan la raíz del error cuadrático medio (RMSE) y la media del error absoluto (MAE), estadísticos que proporcionan una medida del error de la rejilla (Willmott y Matsuura, 2006)<sup>[29]</sup>.

Las rejillas de temperatura media mensual se obtienen de forma derivada a partir de las rejillas de temperatura media mensual de las máximas y de las mínimas, calculando el promedio de ambas en cada punto de rejilla. El empleo de un método de interpolación exacto garantiza que, en el caso de coincidir la localización de una estación con un punto de la rejilla, el valor de la rejilla de temperatura media en ese punto coincidirá exactamente con el valor de temperatura media medido en la estación.

El error de las rejillas de temperatura media se estima a partir de los valores de los residuos de la validación cruzada de las rejillas de temperatura máxima y mínima que intervienen en su cálculo.

Todas las rejillas se elaboran inicialmente con un tamaño de celda de 1 km. Se generan además, como productos derivados, rejillas con un tamaño de celda de 5 km para las dos áreas de trabajo y de 2 km para Canarias, obtenidas todas ellas mediante remuestreo de las rejillas de 1 km.

En el proceso de generación de las rejillas y en su representación en forma de mapas se ha utilizado el sistema de referencia geodésico oficial en España, según lo establecido en el Real Decreto 1071/2007: ETRS89 para la referenciación geográfica y cartográfica en la península ibérica y las islas Baleares, y sistema REGCAN95 en el caso de las islas Canarias. Los mapas y rejillas finales están en proyección UTM huso 30 para la península ibérica, Baleares, Ceuta y Melilla, utilizando el huso 30 extendido para las zonas correspondientes a los husos 29 y 31, y huso 28 para Canarias.

Para la modelización de la altitud se empleó el Modelo Digital del Terreno (MDT200) del Instituto Geográfico Nacional, el cual tiene un paso de malla de 200 m, con distribución por provincias (rectángulo envolvente de cada provincia). Se realizó la composición nacional del MDT, ejecutando a continuación un remuestreo del paso de malla a 1 km.

Asimismo, se empleó la capa vectorial *Líneas límite municipales* del Instituto Geográfico Nacional, que incluye los recintos municipales, provinciales y autonómicos y las líneas límite municipales, provinciales y autonómicas que se encuentran inscritas en la Base de Datos de Límites Jurisdiccionales de España (BDLJE).

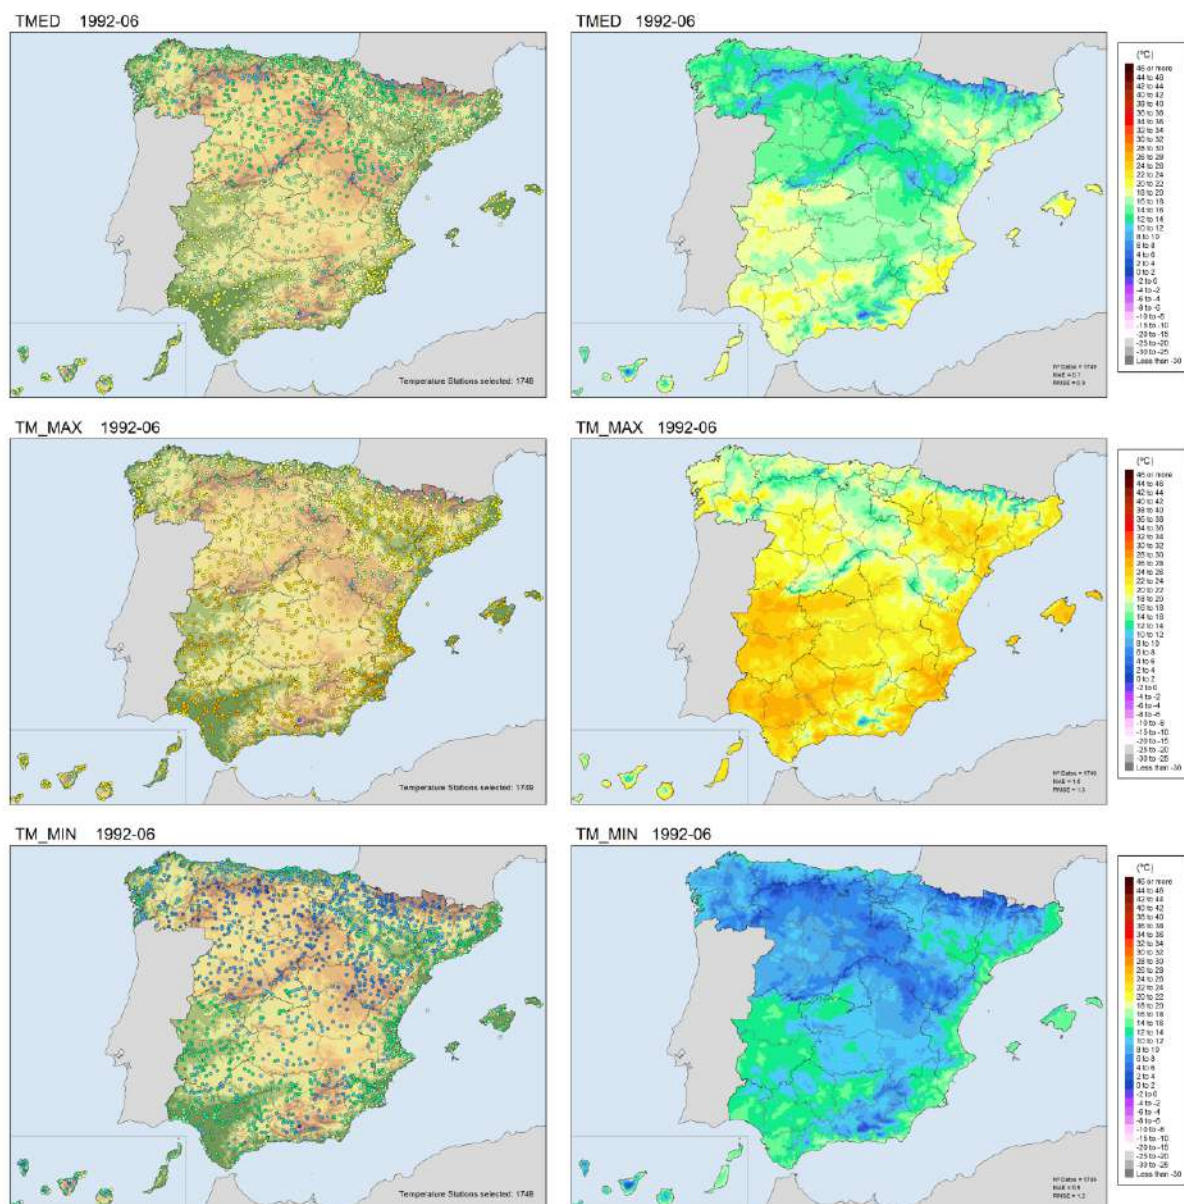

Figura 5: Ejemplos de mapas mensuales de temperatura media, temperatura media de las máximas y temperatura media de las mínimas (dcha.) y estaciones utilizadas para la generación de las rejillas (izda.), correspondientes a junio de 1992.

El software utilizado para la generación de las rejillas, incluyendo el control automático de la calidad de los datos, la estimación de los errores y el remuestreo de las rejillas, fue el sistema de información geográfica libre SAGA GIS (versión 6.3.0) (Conrad et al., 2015)<sup>[8]</sup>, automatizando las tareas mediante programas realizados en el lenguaje de programación R (R Core Team, 2017)<sup>[26]</sup>. Entre los paquetes empleados se encuentran RSAGA (Brenning et al., 2018)<sup>[4]</sup>, tmap (Tennekes, 2018)<sup>[27]</sup> y raster (Hijmans, 2017)<sup>[15]</sup>.

Como ejemplo de las rejillas mensuales generadas, en la Figura 5 se muestran las imágenes correspondiente a las rejillas de temperatura media, temperatura media de las máximas y temperatura media de las mínimas para junio de 1992, junto con la localización de las estaciones utilizadas para obtener las rejillas.

## 2.4 Análisis de los errores

Como se ha comentado en el apartado anterior, una vez generada cada rejilla mensual se calculan la raíz del error cuadrático medio (RMSE) y la media del error absoluto (MAE) en los puntos donde existe observación, con el fin de obtener una medida del error de la rejilla.

Se ha realizado además un análisis de la evolución de estos estadísticos a lo largo del periodo de estudio, incluyendo una comparación de los errores que se obtienen antes de realizar el proceso automático de control de calidad de los datos con los errores finales, resultantes tras la depuración.

Para el ajuste estacional de las series temporales de los errores se ha utilizado el paquete RJDemetra (0.1.1) (Quartier-la-Tente et al., 2019)<sup>[25]</sup>. Se trata de una interfaz para R de JDemetra+, un software de ajuste estacional desarrollado y publicado por Eurostat, oficialmente recomendado<sup>1</sup> para el ajuste estacional de las estadísticas oficiales en la Unión Europea.

Figura 6: Descomposición de la serie de la raíz del error cuadrático medio (RMSE) de las rejillas finales de temperatura media para la España peninsular y Baleares.

Como ejemplo de este análisis, en la Figura 6 se muestra la descomposición de la serie de la RMSE de las rejillas finales de temperatura media mensual para la España peninsular y Baleares. La gráfica superior muestra la serie temporal de la RMSE final para las rejillas de temperatura media (trazo negro) y su tendencia (trazo verde) tras la descomposición efectuada por el método TRAMO-SEATS de RJDemetra. En la gráfica central se muestra la estacionalidad de la serie, es decir, la parte

<sup>1</sup> Recomendación CE: [https://ec.europa.eu/eurostat/cros/system/files/ldemetra\\_%20release.pdf](https://ec.europa.eu/eurostat/cros/system/files/ldemetra_%20release.pdf)

de la señal en la que se detectan comportamientos periódicos asociados a periodos inferiores a un año. Si a la serie original se le extrae la tendencia y la estacionalidad, lo que queda es el ruido, la componente irregular que se muestra en la gráfica inferior. La serie original se puede reconstruir sumando estas tres componentes: la tendencia, la estacionalidad y la componente irregular.

Este análisis se realizó para las series de rejillas iniciales y finales de las tres variables consideradas. En la [Figura 7](#) se muestran las tendencias de la raíz del error cuadrático medio y de la media de los errores absolutos obtenidas para cada una de estas series para la zona geográfica de la España peninsular, Baleares, Ceuta y Melilla. En estas figuras se observa un progresivo descenso del error a lo largo del periodo considerado para las tres variables, lo cual indica un aumento de la calidad de los datos con el transcurso del tiempo. Asimismo, se aprecia en todos los casos una disminución de los errores una vez realizado el control automático de los datos, siendo mayor la disminución en términos absolutos en los primeros años del periodo, en los que la calidad de los datos es inferior.

*Figura 7: Tendencias de la raíz del error cuadrático medio (RMSE) y de la media del error absoluto (MAE) de las rejillas mensuales de temperatura media, temperatura media de las máximas y temperatura media de las mínimas correspondientes a la España peninsular, Baleares, Ceuta y Melilla.*

En el caso de la temperatura media, como se observa en la gráfica la raíz del error cuadrático medio de las rejillas finales toma valores cercanos a 1,3 °C durante los primeros años del periodo, descendiendo progresivamente hasta situarse por debajo de 1,0 °C a partir de los años 1990, llegando a alcanzar valores en torno a 0,7 °C en los últimos años del periodo considerado. Para las rejillas iniciales, generadas antes de realizar el proceso de control automático de calidad de los datos, la raíz del error cuadrático medio se sitúa alrededor de 1,7 °C al comienzo del periodo y en torno a 0,8 °C al final. Se observa, por tanto, una reducción de la RMSE de alrededor de 0,4 °C para las rejillas finales en comparación con las iniciales al comienzo del periodo que se va reduciendo progresivamente hasta situarse aproximadamente en 0,1 °C a finales de la década de 2010.

Los errores de la temperatura media de las máximas y la temperatura media de las mínimas muestran un comportamiento similar al de la temperatura media, si bien toman valores más altos. Al comienzo del periodo los errores de las rejillas finales de ambas variables se sitúan alrededor de 1,8 °C, reduciéndose progresivamente hasta alcanzar valores al final del periodo cercanos a 1,0 °C en el caso de la temperatura media de las máximas y en torno a 1,2 °C para la temperatura media de las mínimas. Resulta destacable que el error de las mínimas se reduce menos que el de las máximas a lo largo del periodo de estudio.

Los resultados anteriores parecen corroborar la eficacia del proceso de validación automática, a la vez que ponen de manifiesto nuevamente la mejora en el tiempo de la calidad de los datos de

temperatura almacenados en el Banco Nacional de Datos Climatológicos a lo largo del periodo 1961-2018.

Por otra parte, extrayendo la tendencia de las series de los errores y representando los valores resultantes agrupados por meses, esto es, representando solo la estacionalidad y la componente irregular de cada mes, se obtienen las gráficas "S-I ratio" que se muestran en la [Figura 8](#), las cuales resultan útiles para analizar los errores en los distintos meses del año. Las líneas horizontales muestran el valor medio del error, una vez extraída la tendencia, de cada mes para todo el periodo analizado. Al mismo tiempo, se representa cada valor del error sin la tendencia del error considerado. Dado que no se considera la tendencia, las gráficas de MAE y RMSE presentan un comportamiento análogo entre sí, tanto en el momento inicial como al final del proceso de validación, por lo que se han mostrado solo las gráficas de la RMSE final del proceso. Del análisis de la gráfica de la temperatura media se desprende que los errores son mayores en el verano, con un máximo en el mes de julio, observándose un máximo secundario de los errores en invierno, durante los meses de diciembre y enero, siendo menores los errores en la primavera y el otoño. Tanto en la temperatura media de las máximas como en la temperatura media de las mínimas los mayores errores se observan también en el verano, siendo este efecto mucho más marcado en la temperatura media de las máximas, variable que presenta unas diferencias estacionales sensiblemente mayores que la temperatura media de las mínimas.

*Figura 8: Gráficas S-I ratio para la RMSE final de la temperatura media (izda.), la temperatura media de las máximas (centro) y la temperatura media de las mínimas (dcha.) correspondientes a la España peninsular, Baleares, Ceuta y Melilla.*

### 3 Productos derivados en rejilla

Las rejillas mensuales de temperatura media, temperatura media de las máximas y temperatura media de las mínimas obtenidas permiten generar diversos productos derivados en rejilla de interés para la vigilancia y el análisis del clima. Se muestran a continuación algunos ejemplos de estos productos.

#### 3.1 Rejillas de valores medios anuales

A partir de las rejillas mensuales se han calculado las rejillas medias anuales para cada año del periodo de estudio 1961-2018, obteniendo, por tanto, 58 mapas medios anuales para cada una de las variables. Los errores de las rejillas anuales se estimaron a partir de los errores de las rejillas mensuales.

En la [Figura 9](#) se muestran, como ejemplo, las imágenes correspondientes a las rejillas de temperatura media anual, temperatura media anual de las máximas y temperatura media anual de las mínimas para el año 1992. En la parte inferior derecha de los mapas se incluye el número de datos empleados en la generación de las rejillas, la media del error absoluto (MAE) y la raíz del error cuadrático medio (RMSE).

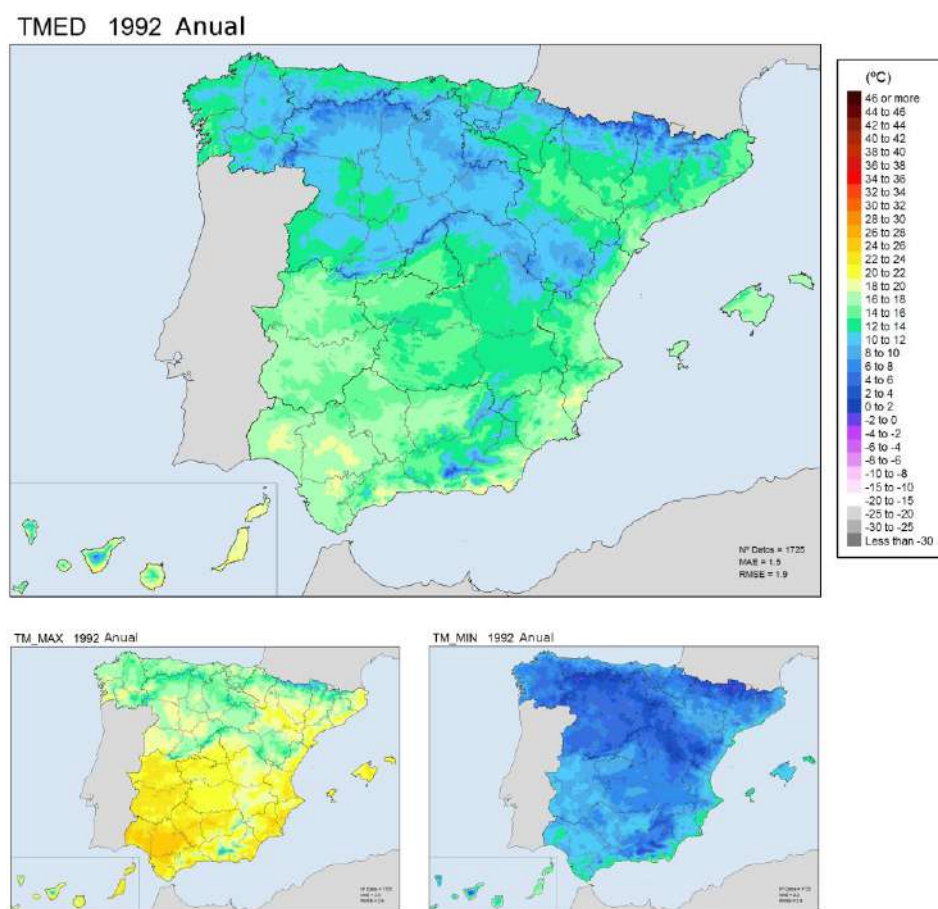

Figura 9: Mapas de valores medios anuales de temperatura media, temperatura media de las máximas y temperatura media de las mínimas para el año 1992.

### 3.2 Rejillas de valores medios por periodos de referencia

Para el análisis de la variabilidad del clima resulta interesante disponer de los mapas de temperaturas medias en los distintos periodos de referencia establecidos por la Organización Meteorológica Mundial. Se han calculado las rejillas medias para cada uno de los tres periodos de referencia de 30 años comprendidos en el periodo de estudio: 1961-1990, 1971-2000 y 1981-2010. Asimismo, se calcularon las rejillas para el periodo incompleto 1991-2018, las cuales pueden ser útiles como una primera aproximación para el periodo de referencia 1991-2020, a falta de los datos de los dos últimos años para completar el periodo.

En las Figuras 10 y 11 se muestran los mapas de valores medios anuales de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas para cada uno de los periodos de referencia. Los errores de las rejillas de cada periodo se estimaron a partir de los errores de las rejillas que intervienen en el cálculo. En el apartado 5.2 se analiza la evolución de las temperaturas en los periodos de referencia a partir de estos resultados.

### 3.3 Rejillas de valores medios anuales para periodos de 10 años

Con el fin analizar la evolución de las temperaturas en periodos de tiempo más cortos, se calcularon también las rejillas de temperatura media anual, temperatura media anual de las máximas y temperatura media anual de las mínimas para cada uno de las decenas comprendidos dentro del periodo de estudio: 1961-1970, 1971-1980, 1981-1990, 1991-2000, 2001-2010 y 2011-2018, considerando este último periodo incompleto como una primera aproximación del decenio 2011-2020.

En la [Figura 12](#) se muestran los mapas de las medias decenales de la temperatura media, y en las [Figuras 13 y 14](#) los mapas de las medias decenales de la temperatura media de las máximas y de las mínimas, respectivamente. En el [apartado 5.2](#) se incluye un análisis de la evolución de las temperaturas por decenios a partir de estos resultados.

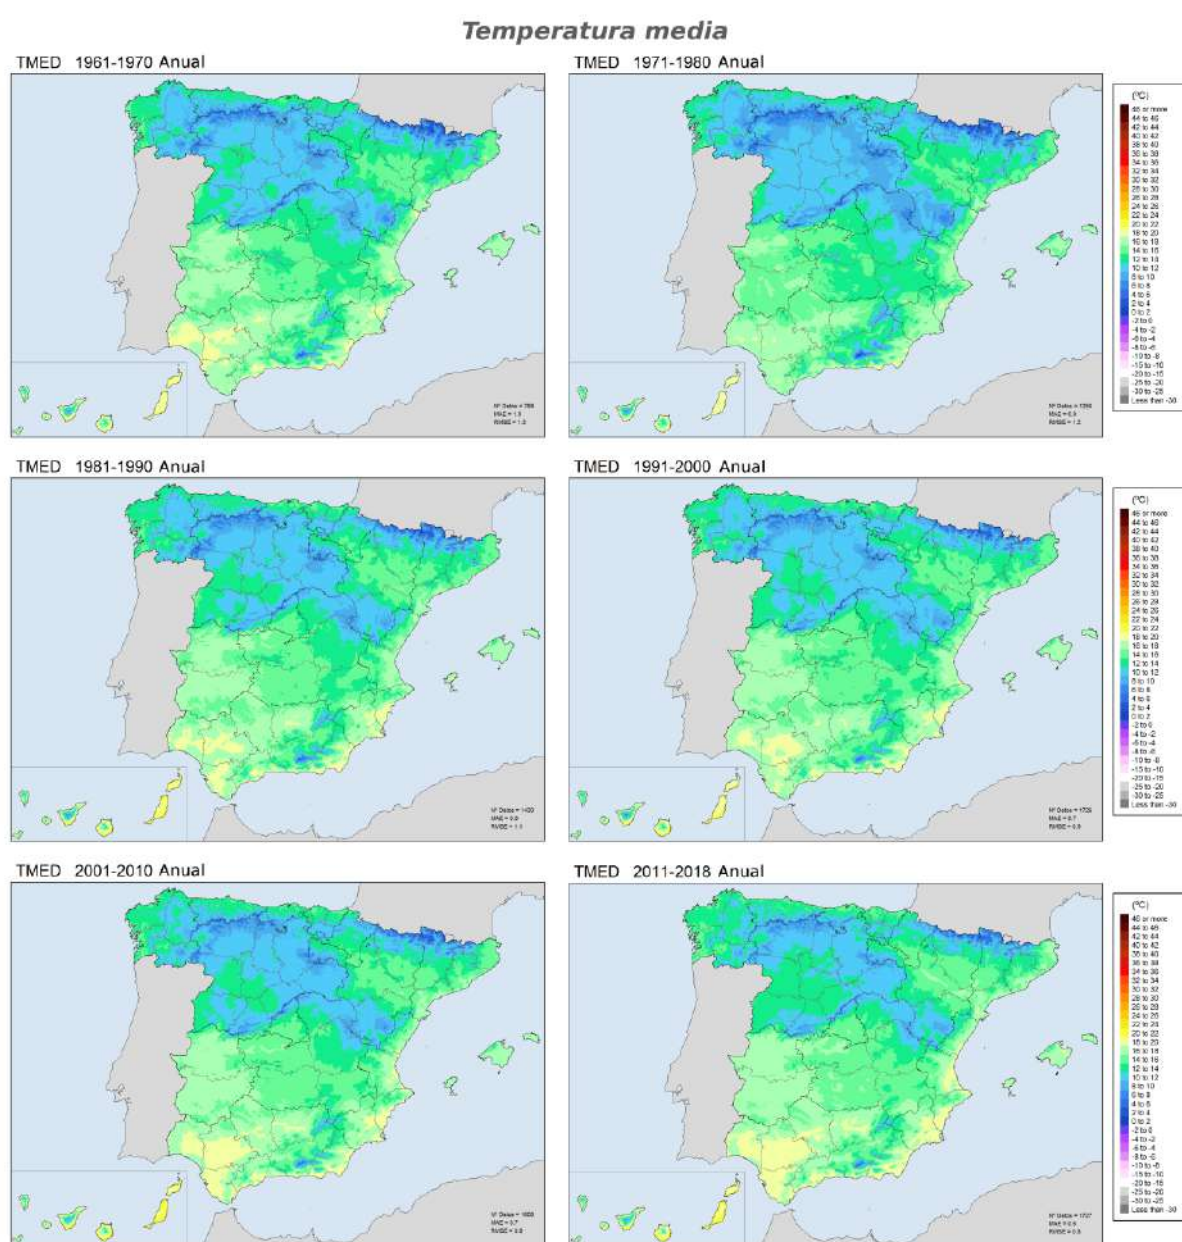

Figura 12: Mapas de temperatura media anual para cada decenio.

### 3.4 Rejillas de anomalías de la temperatura

Al disponer de las rejillas medias mensuales para cada periodo de referencia, resulta inmediato evaluar el comportamiento de la temperatura de cualquier mes comparando los valores de la rejilla del mes con los de la rejilla media del periodo de referencia, obteniendo así la correspondiente rejilla de anomalías térmicas respecto de los valores normales.

En la [Figura 15](#) se muestran, como ejemplo, los mapas de anomalías de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas de junio de 2018 respecto del periodo de referencia 1981-2010.

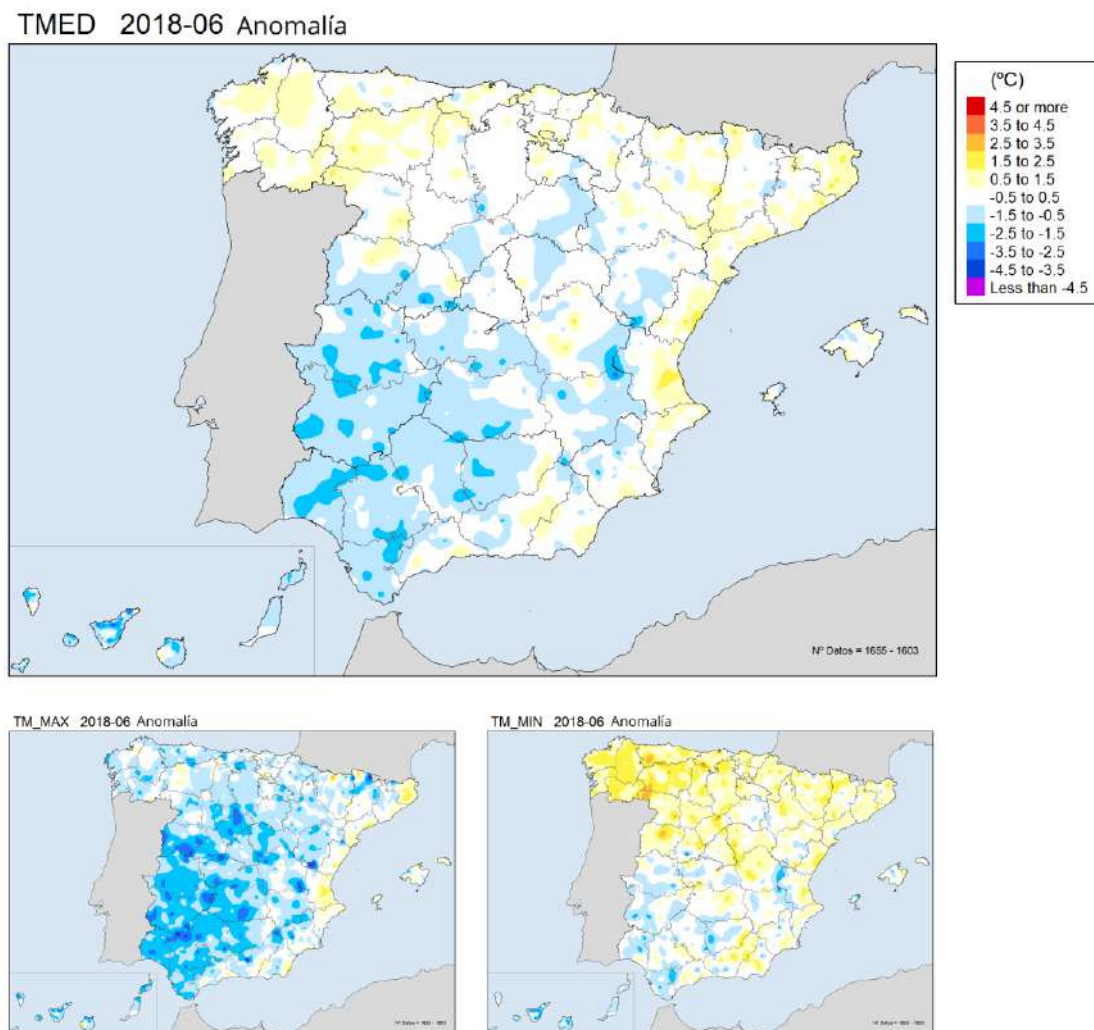

Figura 15: Mapas de anomalías de la temperatura media (arriba), temperatura media de las máximas (izda.) y temperatura media de las mínimas (dcha.) de junio de 2018 respecto del periodo de referencia 1981-2010.

A pesar del evidente interés que tienen estos mapas para estudios climatológicos, conviene tener presente las limitaciones que presentan. Estas se derivan del hecho de que las rejillas mensuales se elaboran con todos los datos disponibles en cada mes, por lo que el número y la localización de las estaciones empleadas en las interpolaciones espaciales pueden variar en el tiempo. Puede ocurrir, por ejemplo, que una estación que se encontraba en funcionamiento el mes en el que se calcula la anomalía no hubiera estado funcionando durante el periodo de referencia. Aunque la utilización en el proceso de interpolación de variables adicionales como la altitud tiende a corregir en parte este problema, es relativamente frecuente observar inconsistencias espaciales de carácter local en las rejillas de anomalías en estos puntos. Resulta, por ello, recomendable emplear para el análisis de las temperaturas las estadísticas por territorios que se describen en el siguiente apartado, en las cuales las inconsistencias de carácter local tienden a compensarse al realizarse los cálculos zonales, obteniéndose resultados más robustos.

## 4 Estadísticas por territorios

Se han utilizado las rejillas mensuales de temperatura 1961-2018 generadas para calcular los valores medios de temperatura media, temperatura media de las máximas y temperatura media de las mínimas para distintas unidades territoriales: provincias, comunidades autónomas, territorio peninsular español, etc. Con el objeto de mantener la coherencia en los cálculos, a la hora de calcular las estadísticas en los diversos territorios se ha partido de los valores calculados sobre las provincias, por tratarse de la unidad territorial más pequeña considerada en el presente estudio. A partir de estos valores se obtuvieron las estadísticas en los demás territorios realizando promedios ponderados según las áreas.

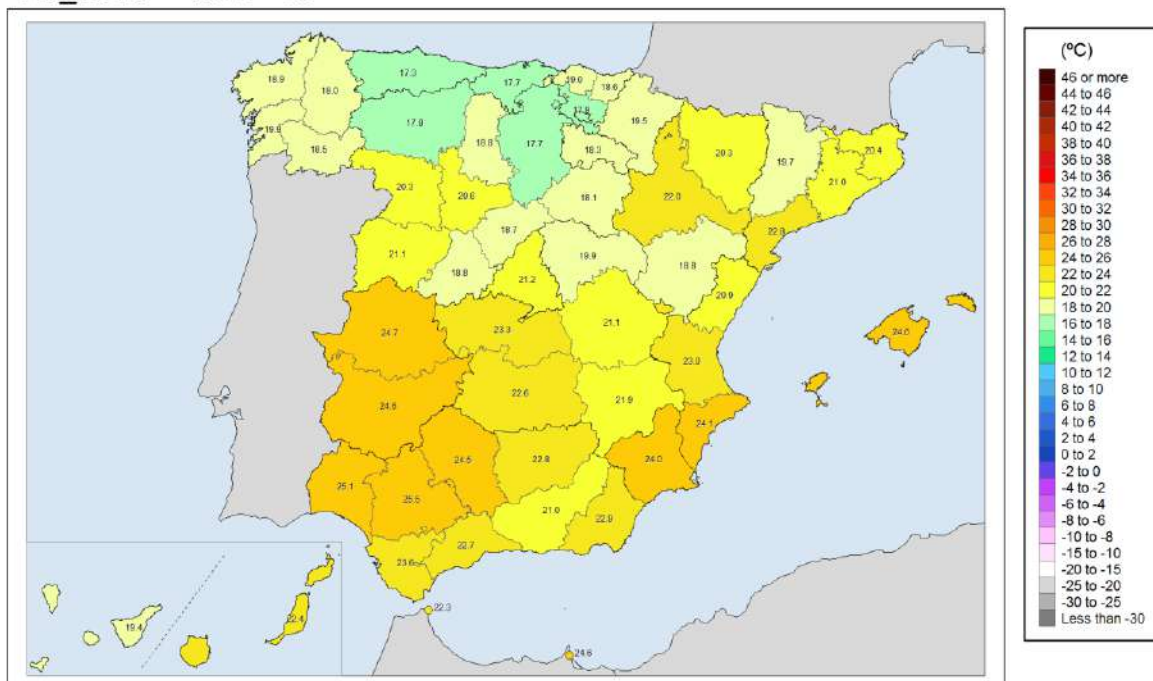

A efectos de cálculo, los territorios correspondientes a las ciudades autónomas de Ceuta y Melilla se consideraron unidades territoriales análogas a las provincias. No obstante, conviene tener en cuenta que, debido al pequeño territorio abarcado por las ciudades autónomas y a su separación geográfica respecto del territorio peninsular, las estadísticas que se obtienen para los territorios de las ciudades autónomas de Ceuta y Melilla presentan resultados mucho menos robustos que los de las provincias y comunidades autónomas, ya que se han obtenido a partir de la interpolación espacial de un número muy reducido de estaciones que, además, han ido variando en el tiempo durante el periodo 1961-2018, por lo que es de esperar que las series obtenidas presenten inhomogeneidades.

TM\_MAX - 1992 - 06

TM\_MIN - 1992 - 06

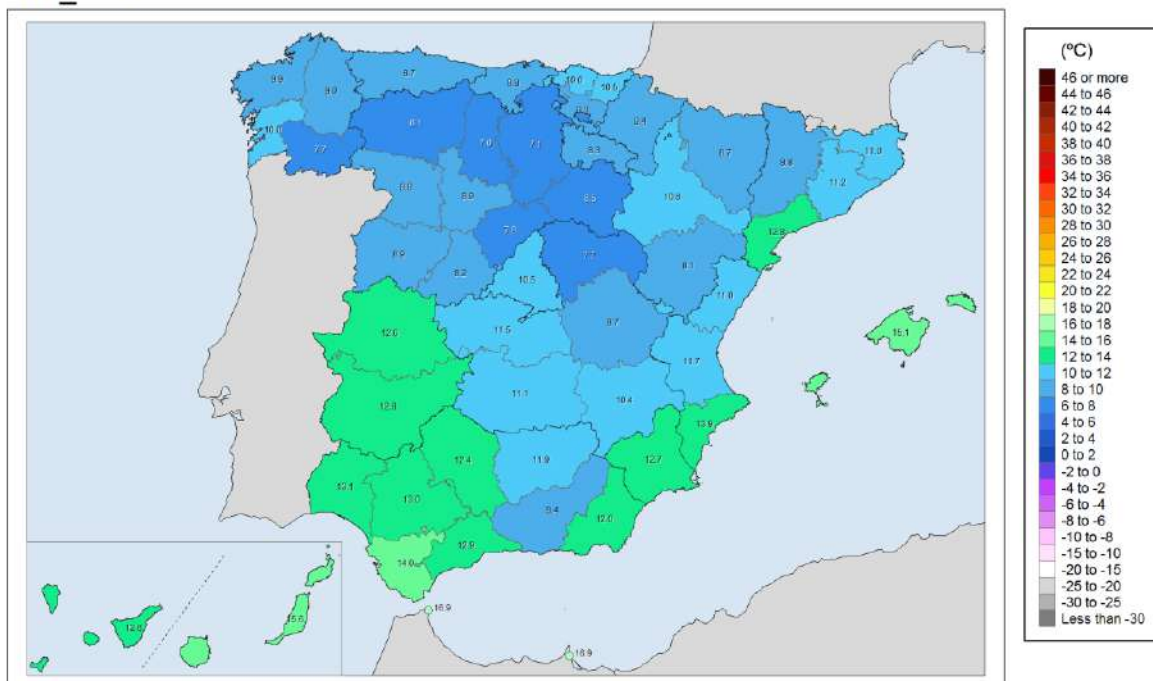

Figura 17: Mapa de las estadísticas provinciales de temperatura media de las máximas (arriba) y de temperatura media de las mínimas (abajo) para junio de 1992.

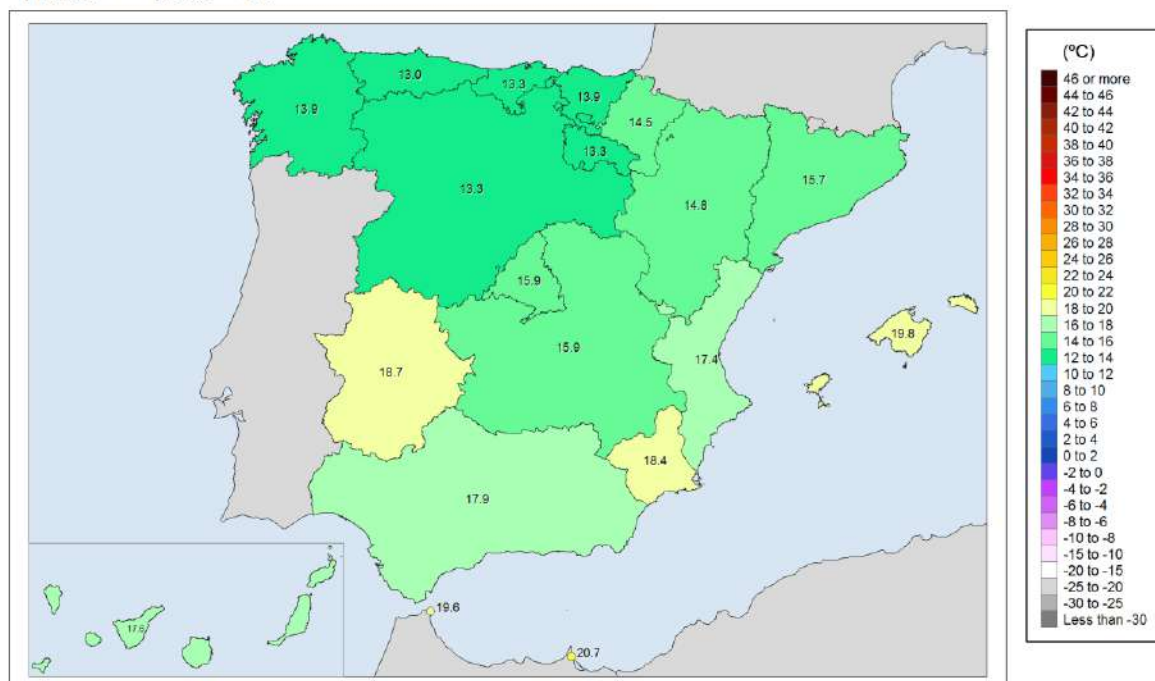

## 4.2 Estadísticas mensuales por comunidades autónomas

Las estadísticas para las comunidades autónomas se obtuvieron a partir de las estadísticas provinciales, realizando una media ponderada según el área de cada una de las provincias que conforman la comunidad autónoma considerada. En la [Figura 18](#) se muestran, como ejemplo, los mapas correspondientes a las estadísticas de temperatura media mensual, temperatura media de las máximas y temperatura media de las mínimas por comunidades autónomas para el mes de junio de 1992.

En el [ANEXO D](#) se pueden consultar las tablas de estadísticas de temperatura media, temperatura media de las máximas y temperatura media para cada comunidad autónoma, así como para las ciudades autónomas de Ceuta y Melilla, durante el periodo de estudio 1961-2018.

TMED - 1992 - 06

TM\_MIN - 1992 - 06

Figura 18: Mapas de estadísticas por comunidades autónomas para junio de 1992. Temperatura media (arriba), temperatura media de las máximas (izquierda) y temperatura media de las mínimas (derecha).

### 4.3 Estadísticas mensuales por zonas geográficas

Se obtuvieron también las estadísticas mensuales para las dos zonas geográficas consideradas en la generación de las rejillas: la España peninsular, Baleares, Ceuta y Melilla, por una parte, y Canarias, por otra.

En el [ANEXO B](#) se muestran las tablas mensuales para el conjunto de la España peninsular, Baleares, Ceuta y Melilla, obtenidas a partir de las estadísticas provinciales. En el caso de la zona geográfica correspondiente a Canarias, al coincidir su extensión con la de la comunidad autónoma, no ha sido necesario repetir el cálculo, mostrándose las estadísticas de esta comunidad en el [ANEXO D.5](#).

Así mismo, se generaron las estadísticas mensuales para el territorio peninsular español a partir de las estadísticas provinciales ([ANEXO C](#)). Aunque estos valores apenas difieren de los valores medios en el conjunto de la España peninsular, Baleares, Ceuta y Melilla, no habiéndose observado diferencias superiores a una décima de grado en ningún valor mensual del periodo 1961-2018, se ha optado por incluirlos además de los anteriores ya que ambos conjuntos de datos pueden resultar relevantes en la vigilancia del clima.

### 4.4 Estadísticas medias anuales

Las estadísticas de cada año del periodo se obtuvieron calculando el valor medio de las estadísticas mensuales de los meses correspondientes para las distintas unidades territoriales consideradas: provincias, comunidades y ciudades autónomas ([ANEXO D](#)), zonas geográficas ([ANEXO B](#) y [ANEXO D.5](#)) y España peninsular ([ANEXO C](#)).

A continuación se muestran, como ejemplo, los mapas con los valores estadísticos provinciales del año 1992 para la temperatura media ([Figura 19](#)), temperatura media de las máximas y temperatura media de las mínimas ([Figura 20](#)).

## TM\_MIN - 1992 - Anual

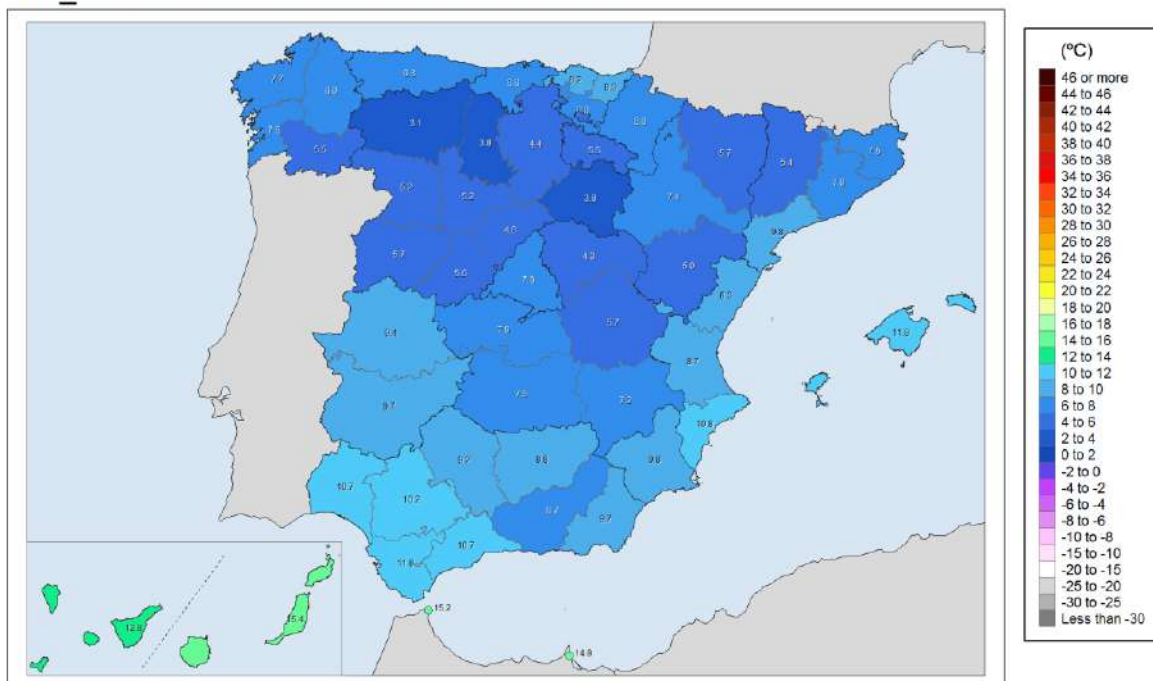

Figura 20: Mapa de las estadísticas anuales provinciales de la temperatura media de las máximas (arriba) y de la temperatura mínima (abajo) del año 1992.

### 4.5 Estadísticas medias por periodos de referencia

Asimismo, resulta inmediato el cálculo de los valores medios por periodos de referencia a partir de las estadísticas anuales. Se han calculado las estadísticas medias territoriales para los periodos de referencia 1961-1990, 1971-2000 y 1981-2010, así como para el periodo incompleto 1991-2018 como primera aproximación del periodo 1991-2020.

A continuación, en las Figuras 21 y 22, se muestran los mapas de las medias anuales de las estadísticas provinciales de temperatura media, temperatura media de las máximas y temperatura media de las mínimas para los distintos periodos de referencia considerados.

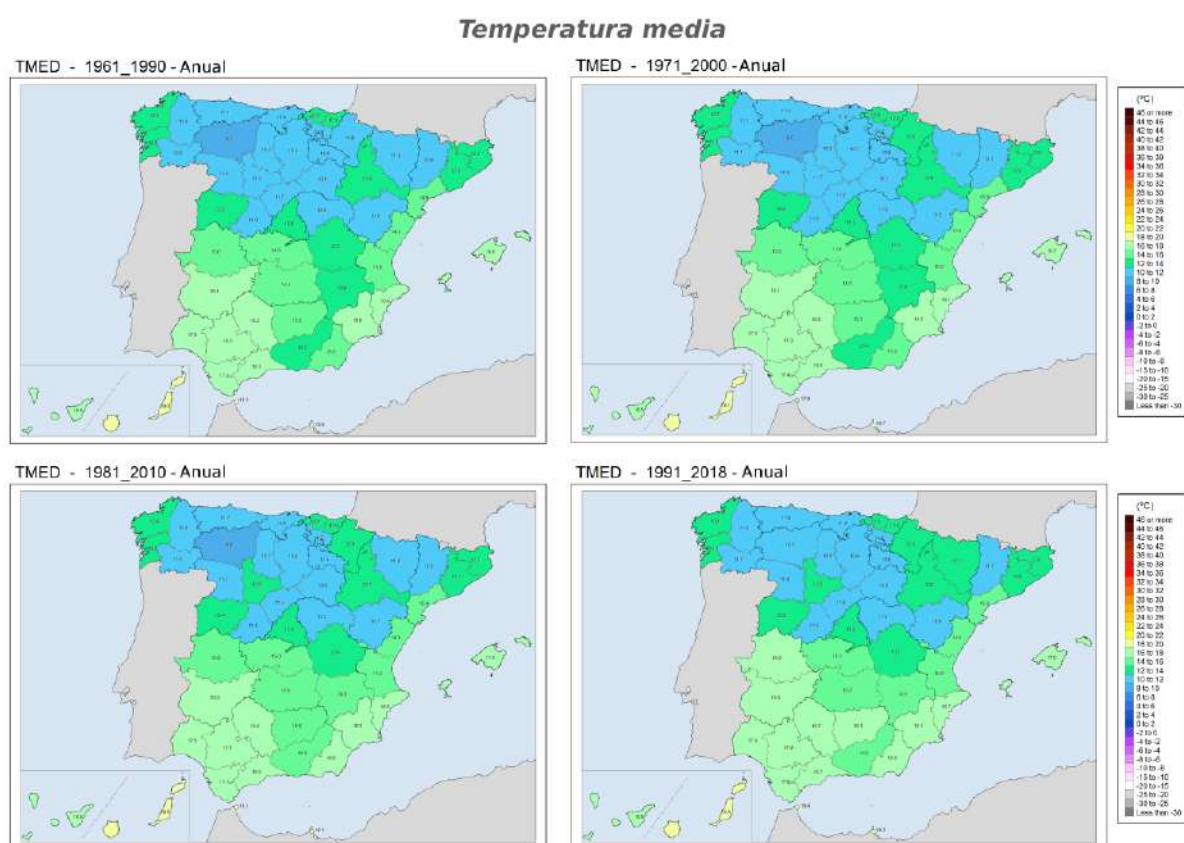

Figura 21: Mapas de las medias anuales provinciales de temperatura media para los periodos de referencia considerados.

## 4.6 Estadísticas medias decenales

Análogamente, se calcularon las estadísticas medias por decenios a partir de las estadísticas territoriales anuales.

A continuación se muestran los mapas de estadísticas provinciales por decenios de la temperatura media anual (Figura 23), temperatura media anual de las máximas (Figura 24) y temperatura media anual de las mínimas (Figura 25).

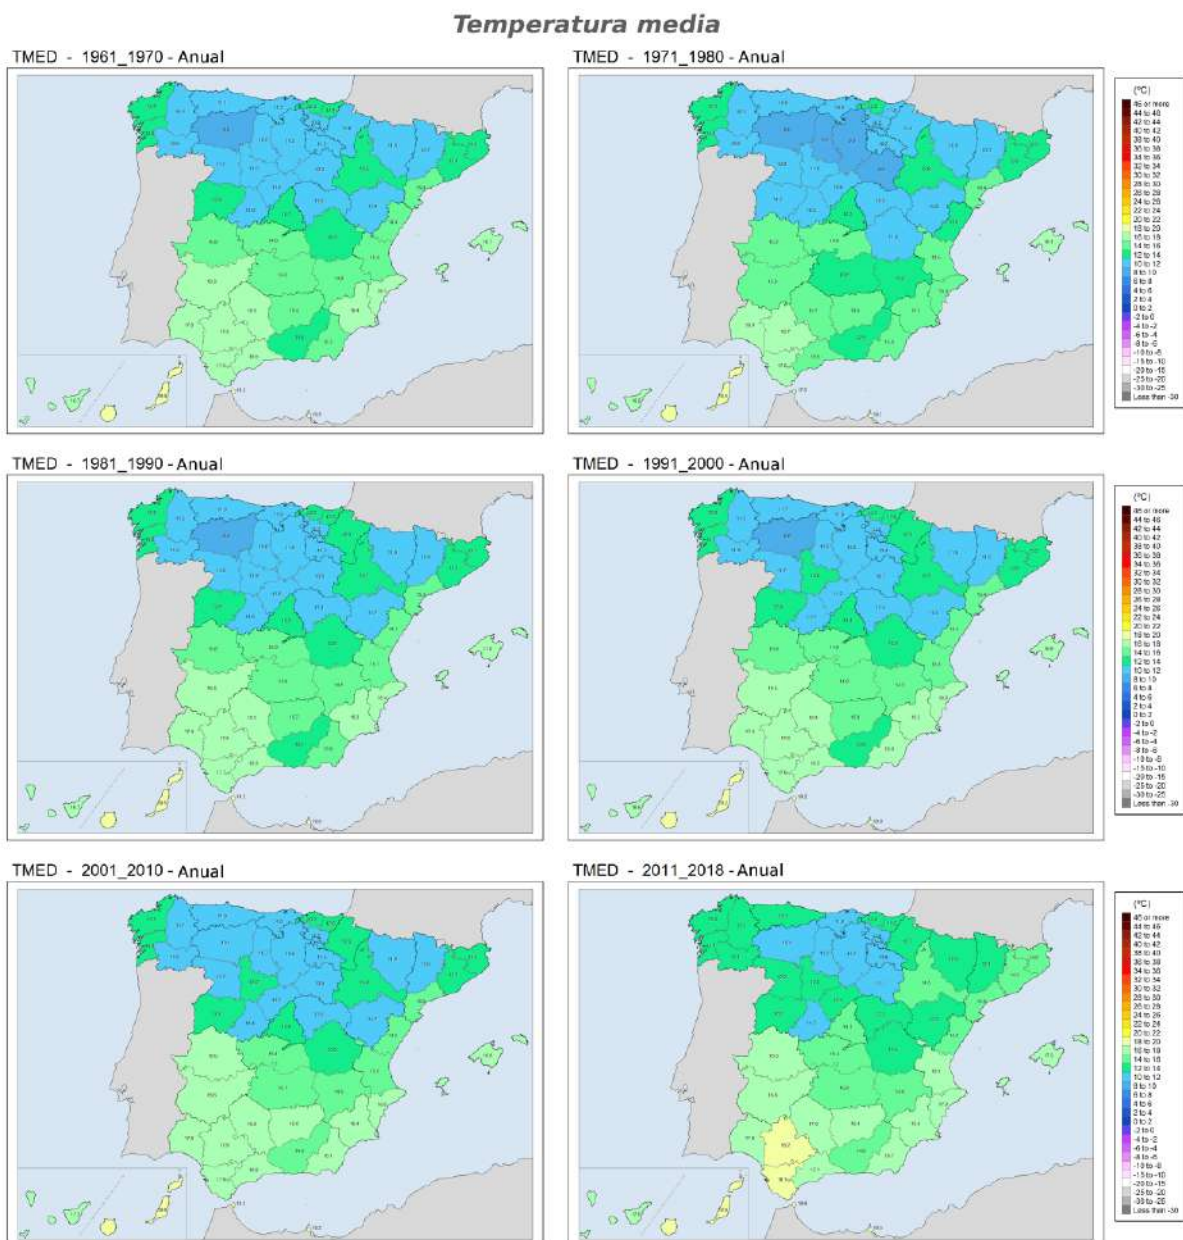

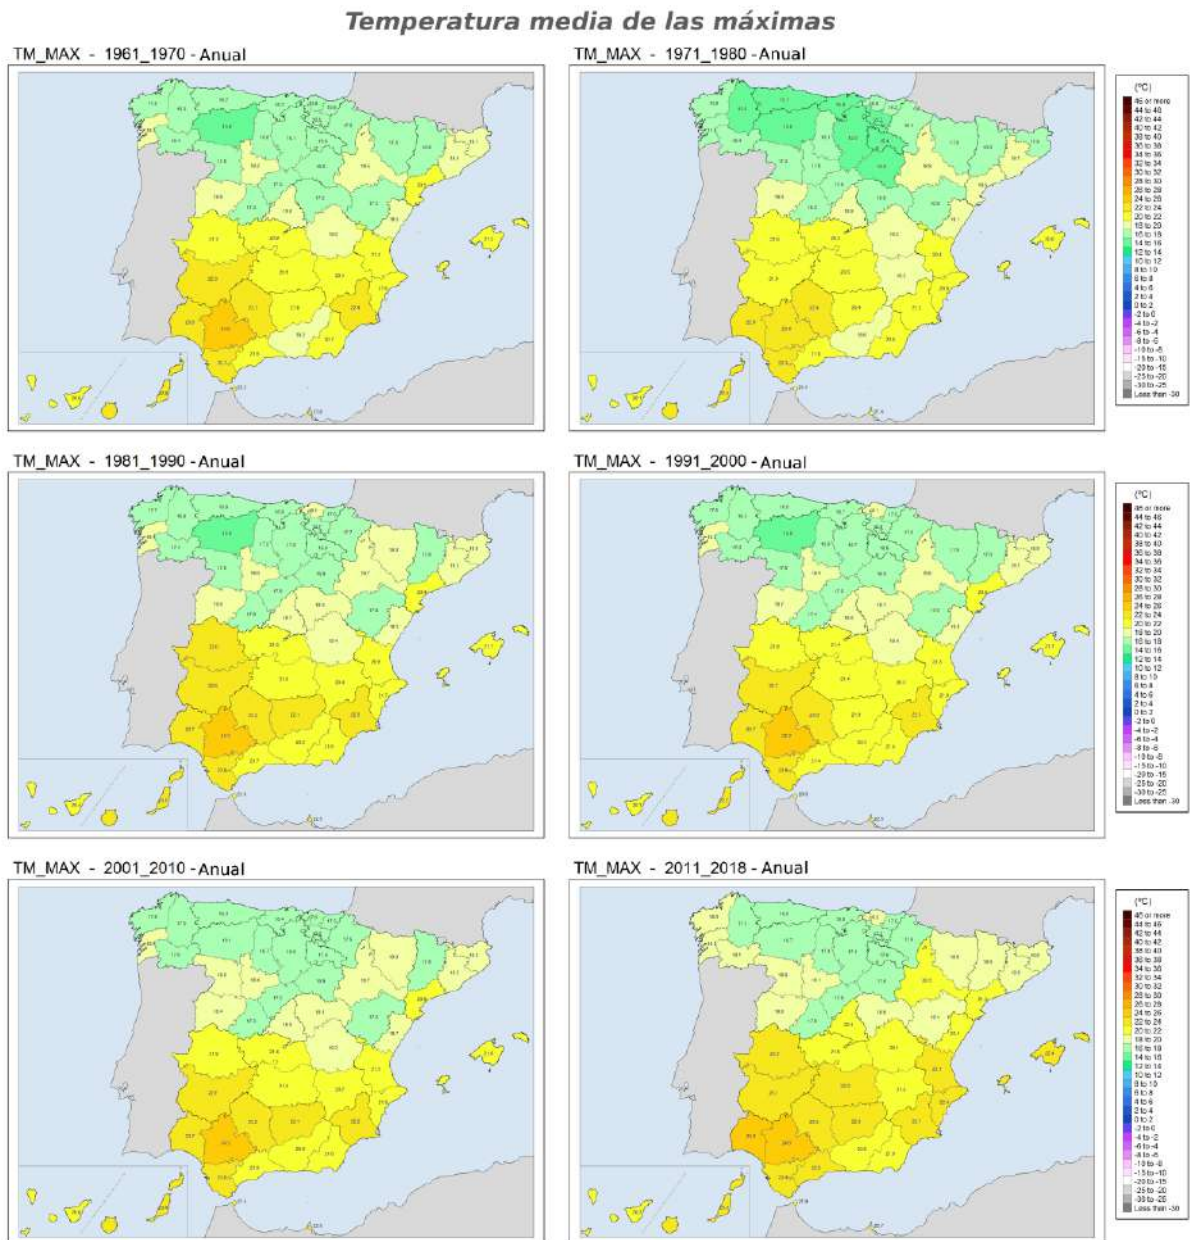

Figura 23: Mapas de estadísticas decenales provinciales de la temperatura media anual.

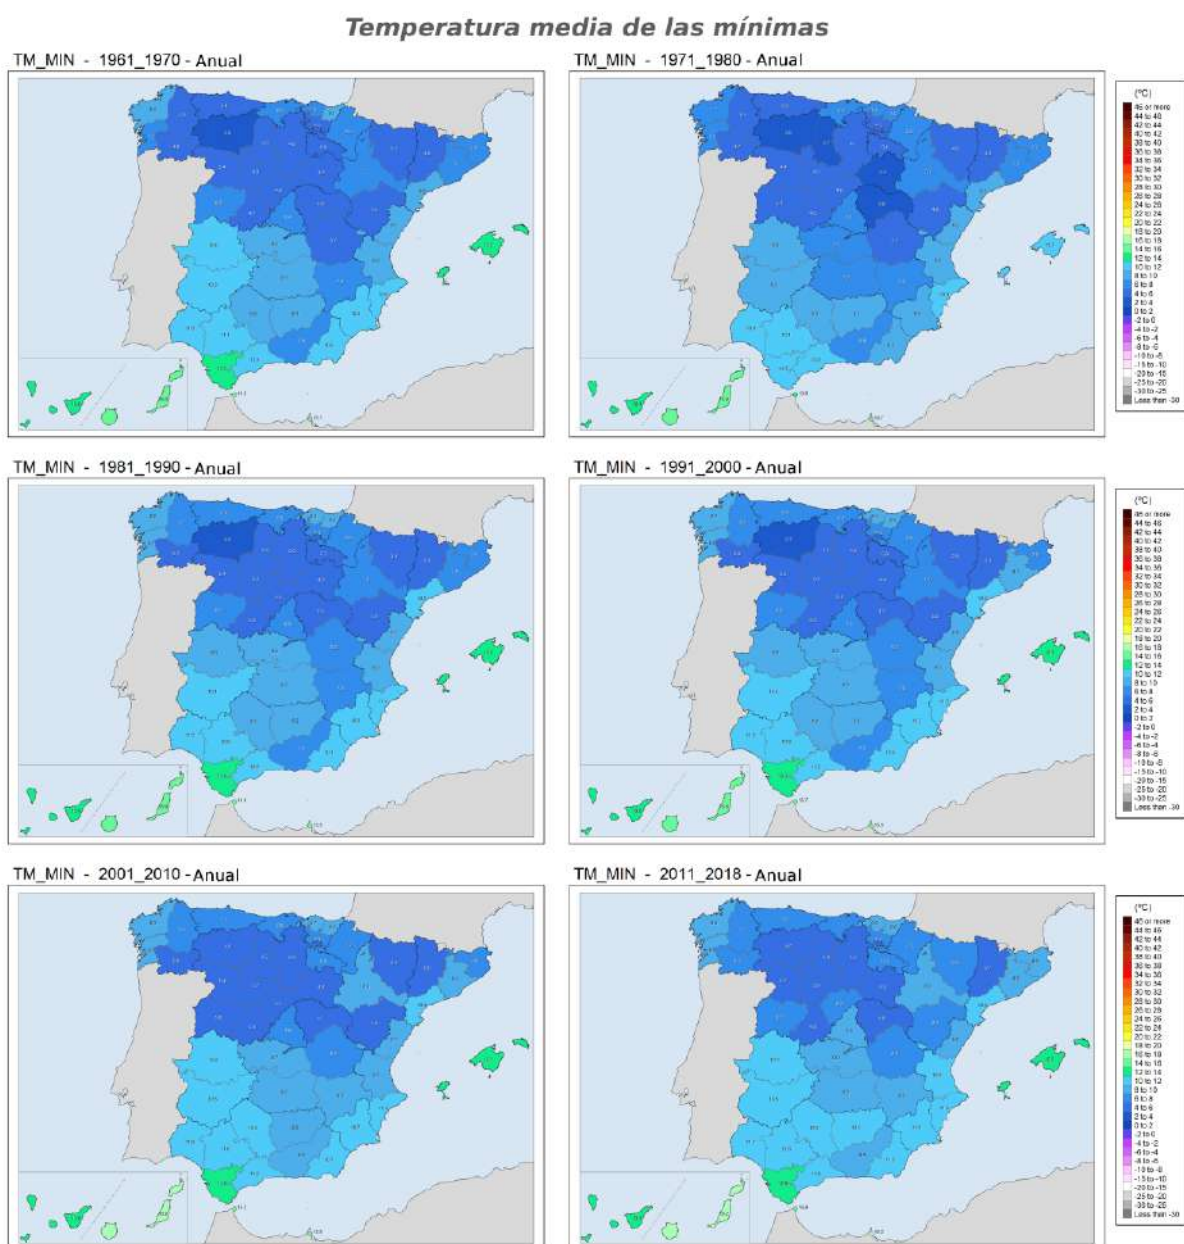

Figura 25: Mapas de estadísticas decenales de la temperatura media anual de las mínimas.

## 4.7 Estadísticas de anomalías térmicas

Una vez calculadas las estadísticas medias para cada periodo de referencia, se puede evaluar el comportamiento de la temperatura de cualquier mes o año comparando las estadísticas territoriales de ese mes o año con las del periodo de referencia, obteniendo así las estadísticas de anomalías térmicas en cada unidad territorial respecto de los valores normales.

En la [Figura 26](#) se muestran, como ejemplo, los mapas de las anomalías provinciales para la temperatura media, la temperatura media de las máximas y la temperatura media de las mínimas de junio de 2018 respecto del periodo de referencia 1981-2010.

TMED - 2018 - 06

TM\_MIN - 2018 - 06

Figura 26: Mapas de anomalías provinciales de la temperatura media (arriba), temperatura media de las máximas (izquierda) y temperatura media de las mínimas (derecha) de junio de 2018 respecto del periodo 1981-2010.

## 5 Análisis de la temperatura a partir de las series de rejillas anuales y estacionales

Los datos en rejilla facilitan el análisis espacial de las variables climáticas y la visualización de los patrones y de las tendencias climáticas, contribuyendo al mismo tiempo a solucionar algunos de los problemas que se derivan del carácter incompleto de los datos observados (OMM, 2018)<sup>[23]</sup>. Resultan, por tanto, conjuntos de datos especialmente adecuados para estudiar la variabilidad del clima.

No obstante, conviene tener en cuenta que el número y la localización de las estaciones empleadas para generar las rejillas varían en el tiempo, siendo posible observar inhomogeneidades de carácter local en puntos de rejilla afectados por estos cambios. Por este motivo, no resulta aconsejable realizar análisis de las temperaturas en puntos de rejilla concretos, siendo más adecuado realizar los análisis partiendo de las estadísticas por territorios que se obtienen a partir de las rejillas, las cuales ofrecen resultados más robustos, especialmente cuando se trata de territorios de un tamaño suficientemente grande para englobar un número elevado de estaciones.

Se describen a continuación los resultados del análisis de las temperaturas del periodo 1961-2018 realizado a partir de las series de rejillas anuales y estacionales para las dos zonas geográficas consideradas.

### 5.1 Descripción de las series anuales y estacionales de temperatura a partir de las rejillas

Con el fin de evaluar el comportamiento de la temperatura en el territorio español durante el periodo 1961-2018, se calcularon los valores medios de cada rejilla mensual de temperatura para las dos regiones geográficas: la zona que abarca la España peninsular, Baleares, Ceuta y Melilla, y la zona de Canarias. En los cálculos se consideraron únicamente los puntos de rejilla situados sobre la superficie terrestre.

A partir de las rejillas mensuales se calcularon las series anuales y estacionales de la temperatura media, la temperatura media de las máximas y la temperatura media de las mínimas para las dos zonas geográficas, cuyo comportamiento se describe en los apartados siguientes. En las figuras que se muestran a continuación se ha marcado con una línea verde el valor medio del periodo de referencia 1981-2010.

#### 5.1.a España peninsular, Baleares, Ceuta y Melilla

Como se observa en el gráfico de temperatura media anual de la zona de la España peninsular, Baleares, Ceuta y Melilla (Figura 27), el periodo estudiado comenzó con un año 1961 muy cálido, con una temperatura media anual 0,5 °C por encima de la media 1981-2010.

Durante la primera mitad de los años 1960 las temperaturas medias anuales se situaron en valores relativamente altos, aunque inferiores a la media 1981-2010. Sin embargo, en los últimos años 1960 y los primeros 1970 se observa un rápido descenso térmico, alcanzándose el mínimo en 1972, año que resultó el más frío del periodo 1961-2018, con una temperatura media anual de 12,1 °C. Los años 1971 y 1974 fueron, respectivamente, el segundo y el tercer año más fríos del periodo 1961-2018.

A partir de 1972 la temperatura media muestra a simple vista una evidente tendencia creciente que abarca el resto de la década de 1970 y la década de 1980, aunque con algún año marcadamente frío como 1984.

A comienzos de los años 1990 se observa un breve periodo de enfriamiento, en el que se sucedieron tres años fríos consecutivos: 1991, 1992 y 1993, siendo 1993 el cuarto año más frío del periodo 1961-2018. Este enfriamiento coincide en el tiempo con la erupción del volcán Pinatubo en junio de 1991, la cual se estima que produjo un descenso de la temperatura global superficial de hasta 0,5 °C, siendo su efecto máximo alrededor de un año después de la erupción (Parker et al., 1996)<sup>[24]</sup>.

A partir de 1994 y hasta 2013 las temperaturas medias anuales se situaron de nuevo en valores en general elevados, pero sin mostrar una tendencia creciente evidente a simple vista. A partir de 2014 las temperaturas medias vuelven a dar indicios de un posible calentamiento, pasando a situarse en valores en general muy altos, destacando por sus elevadas temperaturas los años 2017 y 2015, los dos más cálidos del periodo 1961-2018.

Este comportamiento de la serie anual de temperatura a partir de las rejillas es coherente con el descrito en trabajos anteriores para la España peninsular, revisados exhaustivamente en 2010 por Bladé y Castro-Díez (Bladé & Castro Díez, 2010)<sup>[3]</sup> y en 2017 por Vicente-Serrano y otros (Vicente-Serrano et al., 2017)<sup>[28]</sup>, en los que se describe el bien conocido enfriamiento térmico de los años 1960 y comienzos de los 1970 (Brunet et al., 2007)<sup>[5]</sup>, el rápido calentamiento de los años 1970 y 1980, y la posterior ralentización del calentamiento observada en las décadas de 1990 y 2000 (Gonzalez-Hidalgo et al., 2016)<sup>[13]</sup>, durante las cuales el calentamiento daba muestras de haber cesado o disminuido en intensidad. Sin embargo, las elevadas temperaturas registradas desde 2014 parecen indicar una reactivación del calentamiento en la zona de estudio durante los últimos años, no detectada en los trabajos recientes anteriormente comentados, ya que los periodos que analizaron no abarcaban años posteriores a 2010.

En las figuras siguientes se muestran también los gráficos correspondientes a las medias anuales y estacionales de la temperatura media de las máximas (Figura 28) y de la temperatura media de las mínimas (Figura 29) obtenidas a partir de las rejillas.

En el ANEXO B se pueden consultar las tablas con las temperaturas medias anuales y mensuales de la España peninsular, Baleares, Ceuta y Melilla del periodo 1961-2018 obtenidas a partir de las rejillas.

Figura 27: Temperatura media anual (arriba) y estacional (abajo) para la España peninsular y Baleares.

Figura 28: Media anual (arriba) y estacional (abajo) de la temperatura media de las máximas para la España peninsular y Baleares.

Figura 29: Media anual (arriba) y estacional (abajo) de la temperatura media de las mínimas para la España peninsular y Baleares.

### 5.1.b Canarias

La serie de temperatura media anual de Canarias obtenida a partir de las rejillas ([Figura 30](#)) comienza con un año 1961 excepcionalmente cálido, el tercero más cálido del periodo 1961-2018.

Tras unos años con temperaturas relativamente altas, a finales de los años 1960 y comienzos de los 1970 se observa un descenso térmico, alcanzándose el mínimo absoluto de la serie en 1972, que coincide con el observado en la zona peninsular.

Durante el resto de los años 1970 y los 1980 se aprecia un aumento de las temperaturas medias anuales, aunque con algunos años relativamente fríos como 1986 y 1984.

A comienzos de los años 1990 se observó, al igual que en la península, un mínimo térmico relativo, con cuatro años consecutivos con temperaturas por debajo de la media 1981-2010, resultando 1992 el segundo año más frío de la serie 1961-2018.

A partir de 1994 las temperaturas medias anuales pasaron a situarse en valores relativamente altos, situación que se ha mantenido hasta el final del periodo de estudio sin grandes oscilaciones. Los años más cálidos fueron, por este orden, 2017, 2010 y 1961.

Este comportamiento general de la serie anual de temperatura coincide a grandes rasgos con el descrito en trabajos anteriores para las islas de Tenerife y Gran Canaria (Martín et al., 2012; Luque et al., 2014)<sup>[20][19]</sup>, mostrando el enfriamiento de los 1960 y comienzos de los 1970, tras el cual se dio paso al calentamiento actual, con un enfriamiento de corto plazo a comienzos de los 1990 que coincide con la erupción del Pinatubo y que también se observa en la zona de la península ibérica.

En las [Figuras 31 y 32](#) se muestran las gráficas correspondientes a las medias anuales de temperatura media de las máximas y de temperatura media de las mínimas de Canarias para el periodo 1961-2018, respectivamente.

En el [ANEXO D.5](#) se pueden consultar las tablas con las temperaturas medias mensuales y anuales de la comunidad autónoma de Canarias del periodo 1961-2018 obtenidas a partir de las rejillas.

Figura 30: Temperatura media anual (arriba) y estacional (abajo) para Canarias.

Figura 31: Media anual (arriba) y estacional (abajo) de la temperatura media de las máximas para Canarias.

Figura 32: Media anual (arriba) y estacional (abajo) de la temperatura media de las mínimas para Canarias.

## 5.2 Valores medios de las rejillas anuales y estacionales por periodos de referencia y por decenios

A partir de las rejillas de temperatura se generaron los valores normales para cada periodo de referencia en las dos zonas geográficas. Los valores normales mensuales se obtuvieron calculando el valor medio de las rejillas mensuales del periodo, mientras que los valores normales anuales y estacionales se calcularon hallando la media de los valores normales mensuales correspondientes, siguiendo las recomendaciones de la Organización Meteorológica Mundial para el cálculo de normales climáticas (WMO, 2017)<sup>[31]</sup>. Al faltar dos años para concluir el periodo de referencia 1991-2020, se calcularon los valores medios del periodo incompleto 1991-2018 como una primera aproximación del periodo 1991-2020.

Asimismo, se calcularon los valores medios para cada uno de los decenios comprendidos en el periodo 1961-2018, siguiendo un procedimiento análogo al de los valores normales.

### 5.2.a España peninsular, Baleares, Ceuta y Melilla

Como se aprecia en la [Tabla 1](#), en la que se recogen los valores medios para cada uno de los periodos de referencia, la temperatura media anual de la zona peninsular aumentó tan solo una décima al pasar del periodo 1961-1990 al 1971-2000, aumento que se debió a las temperaturas máximas, que aumentaron ligeramente, mientras que las mínimas no variaron.

*Tabla 1: Valores medios de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas para cada periodo de referencia, obtenidos a partir de las rejillas de la España peninsular, Baleares, Ceuta y Melilla.*

*(\*Los datos del último periodo son orientativos al faltar dos años para completar el periodo 1991-2020)*

En el periodo 1981-2010 se observó un calentamiento significativo, situándose la temperatura media anual  $0,3\text{ }^{\circ}\text{C}$  por encima del valor normal del periodo anterior. El aumento fue ligeramente mayor en la temperatura media de las mínimas ( $0,4\text{ }^{\circ}\text{C}$ ) que en la temperatura media de las máximas ( $0,3\text{ }^{\circ}\text{C}$ ).

A falta de dos años para completar el periodo 1991-2020, los valores provisionales del periodo 1991-2018 indican, por el momento, un aumento de la temperatura media anual de  $0,2\text{ }^{\circ}\text{C}$ , inferior en una décima de grado al experimentado en el cambio de periodo de referencia anterior. De nuevo el aumento de la temperatura media de las mínimas ( $0,2\text{ }^{\circ}\text{C}$ ) resulta ligeramente mayor que el de las máximas ( $0,1\text{ }^{\circ}\text{C}$ ).

Por estaciones del año, se observa que el aumento de la temperatura media a lo largo de los periodos de referencia considerados es significativamente mayor en la primavera ( $0,9\text{ }^{\circ}\text{C}$  de diferencia entre el último y el primer periodo) y en el verano ( $0,7\text{ }^{\circ}\text{C}$ ) que en el otoño (tan solo  $0,1\text{ }^{\circ}\text{C}$ ) y en el invierno ( $0,3\text{ }^{\circ}\text{C}$ ). Destaca el caso del otoño, en el que la temperatura media del periodo 1971-2000 fue  $0,2\text{ }^{\circ}\text{C}$  inferior a la del periodo 1961-1990.

Los mayores aumentos se observan en la temperatura media de las máximas de primavera:  $1,1\text{ }^{\circ}\text{C}$  de diferencia entre el último y el primer periodo considerados. Destaca también el aumento observado en la temperatura media de las mínimas de primavera y verano, de  $0,9\text{ }^{\circ}\text{C}$  en ambos casos.

Los cambios más pequeños se observan en la temperatura media de las máximas de otoño, cuyos valores medios descendieron una décima al pasar del periodo 1961-1990 al 1971-2000 y desde entonces no han variado en los sucesivos periodos de referencia, y en la temperatura media de las mínimas de invierno, que aumentaron solo  $0,3\text{ }^{\circ}\text{C}$  del primer al último periodo.

En cuanto a las temperaturas medias por decenios (Tabla 2), la decena más fría del periodo de estudio fue 1971-1980, con una temperatura media de  $12,8\text{ }^{\circ}\text{C}$ , resultando  $0,6\text{ }^{\circ}\text{C}$  más fría que la decena anterior. Este descenso térmico se observó en todas las estaciones del año salvo en el invierno, cuya temperatura media no varió. En el siguiente decenio, 1981-1990, la temperatura media experimentó un aumento notable, quedando  $0,9\text{ }^{\circ}\text{C}$  por encima del valor medio de 1971-1980. Durante el decenio 1991-2000 la temperatura media no varió, y tan solo aumentó una décima en la decena 2001-2010, evidenciándose un estancamiento en el aumento de las temperaturas medias decenales. Sin embargo, en los ocho años transcurridos hasta ahora de la decena 2011-2020 la temperatura media ha experimentado nuevamente un ascenso significativo, aunque no tan elevado como en 1981-1990, de  $0,4\text{ }^{\circ}\text{C}$  respecto de la media de la decena anterior.

En lo referido a los valores medios decenales por estaciones del año, las mayores variaciones se observan en la primavera, habiendo resultando  $1,8\text{ }^{\circ}\text{C}$  más cálida la temperatura media de primavera de la decena incompleta 2011-2018 que la de la decena 1971-1981, la más fría, siendo el cambio mayor en las temperaturas máximas que en las mínimas.

En los inviernos, en cambio, se observan los menores cambios en la temperatura, habiendo variado la temperatura media tan solo  $0,7\text{ }^{\circ}\text{C}$  entre los decenios más cálidos (1991-2000 y 2011-2018) y los más fríos (1961-1970 y 1971-1980), siendo los cambios en las temperaturas mínimas menores que en las máximas.

(\*Los datos del último periodo son orientativos al faltar dos años para completar el decenio 1991-2020)

### 5.2.b Canarias

En Canarias, las temperaturas medias por periodos de referencia (Tabla 3) muestran un comportamiento similar al caso de la zona peninsular: no variaron en el periodo 1971-2000 respecto del periodo 1961-1990, aumentaron significativamente en el 1981-2010 (0,4 °C de diferencia respecto del periodo anterior), y aumentaron ligeramente en el periodo incompleto 1991-2018 (0,1 °C respecto del 1981-2010).

Por estaciones del año, los mayores aumentos de la temperatura media se observan en la primavera y el verano (0,6 °C en el periodo 1991-2018 respecto del 1971-2000 en ambas estaciones del año), siendo los ascensos térmicos más marcados en las temperaturas mínimas que en las máximas. Los menores aumentos se observan en el otoño, especialmente en las máximas, que tan solo variaron 0,2 °C entre el periodo más cálido (1981-2010) y los periodos más fríos (1961-1990 y 1971-2000).

Tabla 4: Valores medios de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas para cada década, obtenidos a partir de las rejillas de Canarias.

(\*Los datos del último periodo son orientativos al faltar dos años para completar el periodo 1991-2020)

Por decenios (Tabla 4), el más frío del periodo estudiado fue, al igual que en la zona de la península ibérica, el 1971-1980, el cual resultó 0,4 °C más frío que el 1961-1970. Tras un significativo ascenso de 0,7 °C observado en la decena 1981-1990, la temperatura media de la década 1991-2000 resultó, en cambio, 0,2 °C más fría que la anterior. El decenio 2001-2010 fue el más cálido del periodo de estudio, siendo la temperatura media 0,6 °C mayor que la de 1991-2000. Por último, la década incompleta 2011-2018 se sitúa por el momento 0,1 °C por debajo de la 2001-2010.

En cuanto a los valores medios decenales por estaciones del año, los mayores aumentos térmicos se han observado nuevamente en la primavera y el verano, principalmente en las temperaturas mínimas, mientras que los menores aumentos se han producido en el invierno, especialmente en las máximas.

### 5.3 Análisis de tendencias de las series anuales y estacionales

Según el Quinto Informe de Evaluación del IPCC (Hartmann et al., 2013)<sup>[14]</sup>, la temperatura global media mostró un calentamiento de 0,85 °C (0,65 a 1,06 °C) durante el período 1880-2012, equivalente a 0,06 °C/decenio. Durante los últimos años el ritmo del calentamiento ha sido mayor, estimándose en 0,72 °C (0,49 a 0,89 °C) en el periodo 1951-2012, lo que equivale a 0,12 °C/decenio. Este incremento en la temperatura global no está distribuido homogéneamente sino que varía en magnitud de unas regiones a otras, siendo mayor en general sobre la superficie terrestre que sobre los océanos. Por otra parte, la temperatura media superficial global muestra una sustancial variabilidad decadal e interanual. Debido a la variabilidad natural, las tendencias basadas en periodos de tiempo cortos son muy sensibles a las fechas de comienzo y de fin de los periodos y no reflejan bien en general las tendencias climáticas de largo plazo, como se recoge en los últimos informes del IPCC. Por todo ello, es habitual encontrar diferencias significativas en las tendencias de la temperatura dependiendo del periodo considerado, la zona geográfica y el conjunto de datos utilizado.

Con el objeto de evaluar el calentamiento experimentado en el territorio español durante el periodo 1961-2018, se ha realizado un análisis de las tendencias de las series de temperatura anuales y estacionales obtenidas a partir de las rejillas para las dos zonas de estudio.

#### 5.3.a España peninsular, Baleares, Ceuta y Melilla

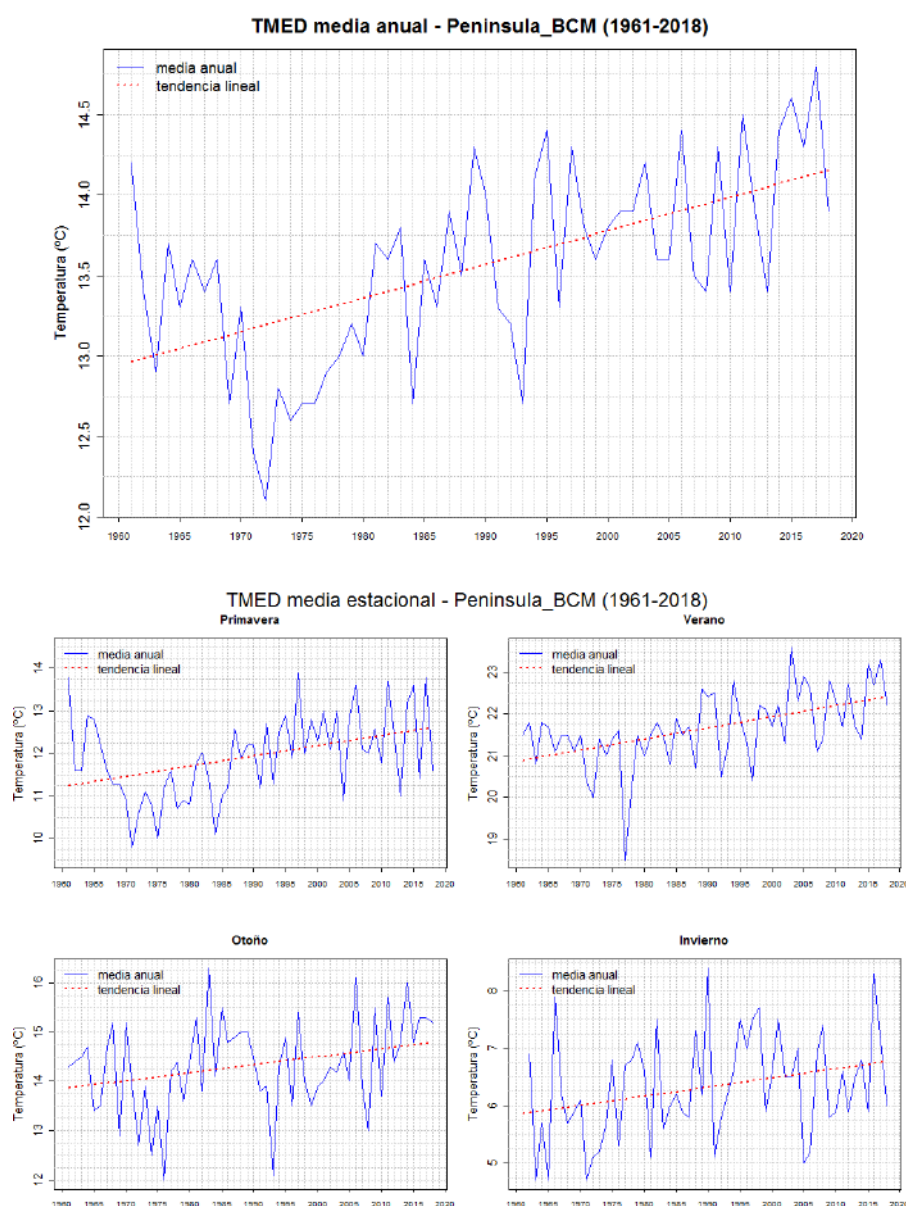

En la Figura 33 se ha representado en color azul la serie de temperaturas medias anuales 1961-2018 correspondiente a la zona de la España peninsular, Baleares, Ceuta y Melilla, y en línea roja discontinua la tendencia lineal obtenida mediante ajuste de mínimos cuadrados.

Analizando a simple vista la serie, cuyo comportamiento se describió previamente en el apartado 5.1.a, se aprecia una tendencia general creciente para el conjunto del periodo analizado. Con un detalle mayor, se observa durante los años 1960 y comienzos de los 1970 una tendencia decreciente en la temperatura media, alcanzándose un mínimo absoluto en 1972. Durante el resto de los años 1970 y los 1980 se aprecia, en cambio, una evidente tendencia creciente, que queda interrumpida en los primeros años 1990, en los que se observa un enfriamiento de corto plazo, atribuido por diversos autores a los efectos de la erupción del volcán Pinatubo (Gonzalez-Hidalgo et al., 2016)<sup>[13]</sup>. Desde mediados de los años 1990 las temperaturas medias parecen estabilizarse, manteniéndose en valores altos pero sin mostrar una tendencia evidente hasta mediados de los 2010. Por último, desde 2014 los registros de temperatura comienzan a dar muestras de una

posible reactivación del calentamiento, habiéndose alcanzado los valores más altos de la serie en este periodo.

En la **Figura 33** se han representado también las series y las tendencias lineales para cada una de las cuatro estaciones del año. A simple vista, se aprecia una tendencia creciente general en las series de las cuatro estaciones, aunque con diferencias entre ellas. Durante los años 1960 y comienzos de los 1970 resulta evidente un descenso térmico en las temperaturas medias de primavera y otoño, similar al experimentado por las temperaturas medias anuales, y más ligero en las temperaturas de verano, mientras que en los inviernos no se aprecia a simple vista una tendencia clara en ese decenio. Por otra parte, la marcada tendencia creciente de los años 1970 y 1980 de las series anuales se observa también en las series estacionales, aunque de nuevo de forma más evidente en el caso de la primavera y el otoño.

*Figura 33: Evolución de la temperatura media anual y estacional para la España peninsular, Baleares, Ceuta y Melilla según los datos en rejilla 1961-2018.*

Esta descripción a simple vista de las tendencias de la serie anual y las series estacionales coincide a grandes rasgos con la descrita por (Luna et. al, 2012)<sup>[18]</sup> en el trabajo “Tendencias observadas en España en precipitación y temperatura”, en el cual se analizaron las tendencias de la temperatura en la España peninsular y Baleares durante el periodo 1965-2010 a partir de series de temperatura media generadas con los datos de 42 estaciones, si bien el periodo abarcado en dicho estudio era menor.

En la **Tabla 5** se muestra la tendencia anual y las tendencias estacionales de la temperatura media en el periodo 1961-2018, expresadas en °C/decenio, junto con los errores estimados de las tendencias, suponiendo normalidad en la distribución de los residuos, y sus niveles de significación calculados con los test de Kendall y de Spearman. Se han marcado en negrita las tendencias significativas al 5 % pero no al 1 % según los test aplicados, y en negrita y cursiva las significativas al 1 % (los resultados de ambas pruebas con estos niveles de significación coinciden).

TMED (°C/década) (1961-2018)			
	tendencia	p-valor Kendall	p-valor Spearman
<b>Anual</b>	<b>0.21±0.04</b>	5.7666×10 <sup>-06</sup>	1.9273×10 <sup>-06</sup>
<b>Primavera</b>	<b>0.24±0.07</b>	1.2369×10 <sup>-03</sup>	1.7156×10 <sup>-03</sup>
<b>Verano</b>	<b>0.27±0.06</b>	1.3003×10 <sup>-04</sup>	4.7058×10 <sup>-05</sup>
<b>Otoño</b>	<b>0.16±0.07</b>	0.0311	0.0278
<b>Invierno</b>	<b>0.16±0.07</b>	0.0264	0.0305

*Tabla 5: Tendencias de la temperatura media para la España peninsular, Baleares, Ceuta y Melilla en el periodo 1961-2018 a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %).*

La tendencia de la temperatura media obtenida para el periodo completo 1961-2018 es de 0,21 °C/decenio. Esta tendencia resulta significativa al 1 % y presenta además un p-valor muy bajo, por lo que resulta altamente improbable que dicha tendencia se trate simplemente de un fenómeno aleatorio. El verano y la primavera son las estaciones del año que más han contribuido al calentamiento en el periodo 1961-2018, mostrando ambas tendencias significativas al 1 % con valores de 0,27 y 0,24 °C/decenio, respectivamente. Las temperaturas medias de otoño y de invierno presentan tendencias claramente menores, de 0,16 °C/decenio en ambos casos, las cuales resultan estadísticamente significativas al 5 % pero ya no al 1 %.

La tendencia anual media obtenida, de 0,21 °C/decenio en el periodo 1961-2018, resulta algo mayor que la tendencia global para el conjunto de la superficie terrestre y oceánica estimada para el mismo periodo a partir de los conjuntos de datos globales NOAA/GISSTEMP, que es de 0,17 °C/decenio, y HadCRUT4, de 0,15 °C/decenio (ver [ANEXO A.1](#)). En cambio, resulta muy similar a la tendencia global de la superficie terrestre estimada por el conjunto de datos CRUTEM, de 0,23 °C/decenio, y ligeramente inferior a la estimada sobre la superficie terrestre del hemisferio norte por CRUTEM, de 0,27 °C/decenio (ver [ANEXO A.3.b](#)), ambas calculadas para el periodo 1961-2018.

Comparando con otros estudios previos realizados en la zona de estudio en periodos de tiempo similares, la tendencia obtenida para la temperatura media anual es sensiblemente inferior a la estimada por Luna et al. en la España peninsular y Baleares para el periodo 1965-2010, obtenida a partir de series de temperatura media generadas con los datos de 42 estaciones, que era de 0,37 °C/decenio (Luna et. al, 2012)<sup>[18]</sup>, si bien el periodo temporal considerado en dicho estudio era sensiblemente inferior. También resulta menor que el calentamiento estimado por Vicente-

Serrano et al. para España desde 1960 en su revisión de diversos trabajos previos, que es del orden de 0,3 °C/decenio (Vicente-Serrano et al., 2017)<sup>[28]</sup>, aunque es ligeramente superior al estimado por Del Río et al. para el periodo 1961-2006 en la España peninsular, de 0,1 a 0,2 °C/decenio (Del Río et al., 2011)<sup>[9]</sup>.

Por otra parte, se han calculado también las tendencias de la temperatura media para cada uno de los periodos de referencia de 30 años comprendidos en el periodo de estudio (Tabla 6).

En el periodo de referencia 1961-1990, caracterizado como se ha comentado anteriormente por un enfriamiento hasta 1972 y un posterior aumento de las temperaturas, no se observan tendencias significativas al 5 %.

Durante el periodo de referencia 1971-2000, el cual engloba los años de mayor crecimiento de las temperaturas en España, los valores medios anuales muestran una marcada tendencia positiva de 0,49 °C/decenio, significativa al 1 %. Por estaciones del año, destaca el valor extraordinariamente elevado de la tendencia en la primavera, de 0,81 °C/decenio y significativa al 1 %, así como las tendencias del verano y del invierno, de 0,46 y 0,47 °C/decenio respectivamente, significativa la primera al 1 % y la segunda al 5 %. La tendencia del otoño, mucho menor que las anteriores, no resulta en cambio significativa al 5 %.

Tendencia TMED (°C/década)

Tabla 6: Tendencias de la temperatura media para la España peninsular, Baleares, Ceuta y Melilla por periodos de referencia a partir de los datos en rejilla para cada periodo de referencia (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %).

En el periodo de referencia 1981-2010 se pone de manifiesto una disminución en el aumento de las temperaturas respecto del treintenio anterior, con una tendencia en los valores anuales de tan solo 0,12 °C/decenio que no resulta significativa al 5 %. La tendencia en el invierno es prácticamente nula y la del otoño incluso negativa, aunque tampoco ninguna de ellas es significativa al 5 %. Únicamente la primavera presenta valores significativos al 5 % en este periodo, con una tendencia de 0,39 °C/decenio.

Por último, en el periodo incompleto 1991-2018 se vuelve a observar una tendencia creciente en la temperatura media anual, significativa al 5 % pero no al 1 %, de 0,29 °C/decenio. Esta tendencia se debe principalmente a las temperaturas medias de otoño, las cuales muestran una elevada tendencia creciente, de 0,60 °C/decenio y significativa al 1 %. En el resto de estaciones las tendencias no resultan significativas al 5 %.

En cuanto a la temperaturas medias anuales de las máximas y de las mínimas (Figura 34), se obtienen tendencias muy similares a la temperatura media en el periodo 1961-2018, con valores de 0,20 °C/década y 0,21 °C/década respectivamente, ambas significativas al 1 % (ver Tabla 7).

Tabla 7: Tendencias de la temperatura media de las máximas (izda.) y de las mínimas (dcha.) para la España peninsular, Baleares, Ceuta y Melilla en el periodo 1961-2018 a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %).

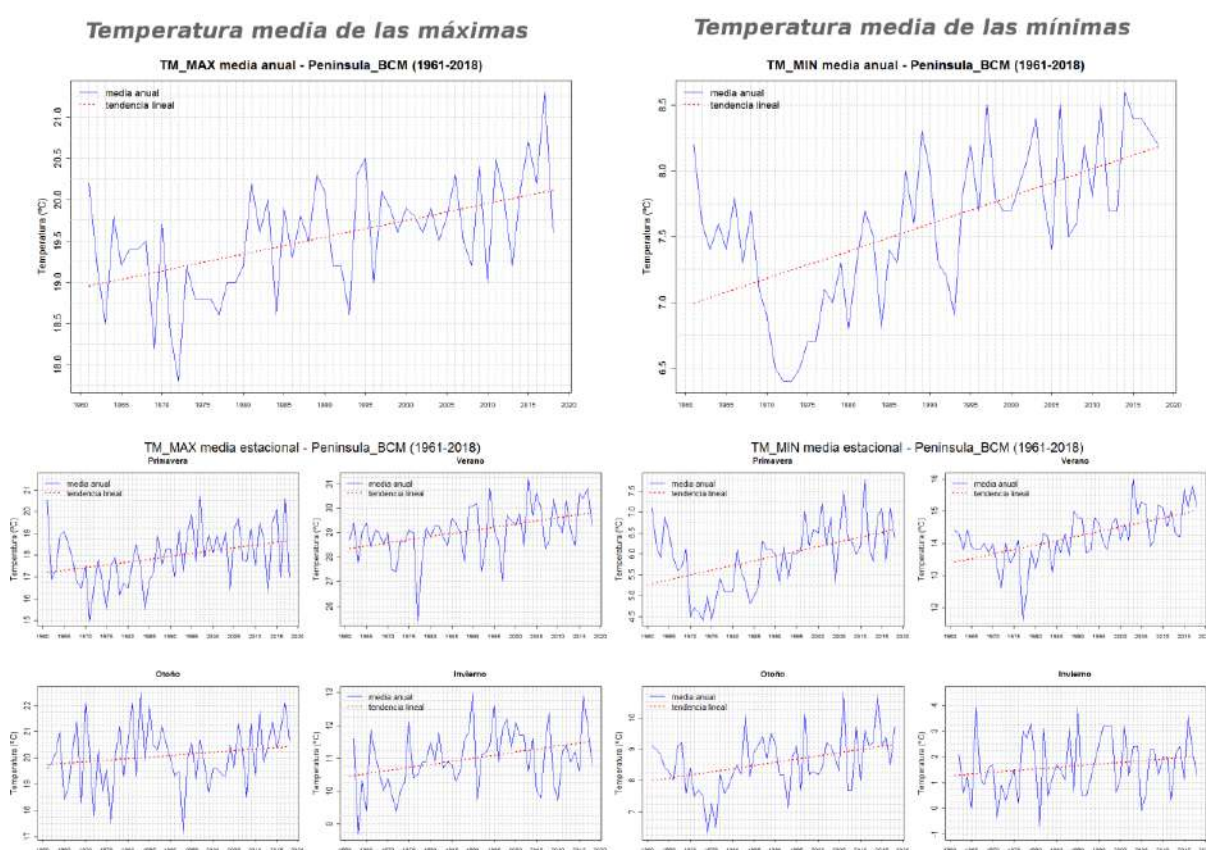

Figura 34: Evolución de la temperatura media anual y estacional de las máximas (izda.) y de las mínimas (dcha.) para la España peninsular, Baleares, Ceuta y Melilla según los datos en rejilla 1961-2018.

En el análisis estacional de la temperatura media de las máximas las mayores tendencias se observan en la primavera y el verano, de  $0,26 \text{ °C/decenio}$  ambas y significativas al 1 %. La tendencia en el invierno es menor ( $0,19 \text{ °C/decenio}$ ) y resulta significativa solo al 5 %, mientras que en el otoño la tendencia no es significativa al 5 %.

En cuanto al comportamiento estacional de la temperatura media de las mínimas, se observan tendencias significativas al 1 % en el verano, la primavera y el otoño, con valores de  $0,28 \text{ °C/decenio}$ ,  $0,23 \text{ °C/decenio}$  y  $0,20 \text{ °C/decenio}$ , respectivamente. La tendencia en el invierno no resulta significativa al 5 %.

En el análisis de la temperatura media de las máximas y de las mínimas por periodos de referencia de 30 años (Tabla 8), las mayores tendencias anuales y estacionales se observan en el periodo 1971-2000, destacando el elevado valor de la tendencia de la temperatura media de las máximas en primavera, de 0,95 °C/década. La temperatura media anual de las máximas únicamente presenta una tendencia significativa durante el periodo 1971-2000, mientras que la temperatura media anual de las mínimas muestra tendencias significativas también en los periodos 1981-2010 y 1991-2018, aunque con valores menores que en el periodo 1971-2000. La temperatura media de las mínimas en invierno no muestra una tendencia significativa en ninguno de los periodos de referencia.

Tabla 8: Tendencias de la temperatura media de las máximas (arriba) y de la temperatura media de las mínimas (abajo) para la España peninsular, Baleares, Ceuta y Melilla por periodos de referencia a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %).

Finalmente, para evaluar de una forma más precisa la evolución de las tendencias a lo largo del periodo de estudio, se ha representado gráficamente (Figura 35) un análisis de las tendencias en ventanas móviles de 30 años para la temperatura media anual, la temperatura media anual de las máximas y la temperatura media anual de las mínimas en el periodo 1961-2018.

En las tres variables se observa un aumento progresivo de las tendencias móviles en 30 años hasta alcanzar un máximo alrededor del periodo 1971-2000, y un posterior descenso hasta el periodo 1981-2010. A partir de entonces, las tendencias se han mantenido más o menos constantes, si bien al final del periodo se observa un aumento de las tendencias en la temperatura media debido a un calentamiento en la temperatura media de las máximas, el cual no se observa por el momento en la temperatura media de las mínimas.

En la Figura 35 se observa también que durante los primeros años del periodo estudiado la tendencia de la temperatura media de las máximas era mayor que la de las mínimas, por lo que había un aumento de la oscilación térmica diurna. En el periodo 1967-1996 ambas tendencias se igualan, pasando a partir de entonces a ser mayor la tendencia de la temperatura media de las mínimas que la de las máximas, dando lugar a una disminución de la oscilación térmica diurna. En los últimos años, el aumento de la tendencia de la temperatura media de las máximas ha dado lugar a que vuelvan a igualarse las tendencias de las máximas y de las mínimas en el periodo 1988-

2017. Esta evolución de la oscilación térmica diurna en la zona de la España peninsular coincide en parte con la descrita a escala global en el Quinto Informe del IPCC, en el que se describe una disminución del rango térmico diurno a partir de mediados del siglo XX, con temperaturas mínimas diarias creciendo más rápidamente que las máximas, y un posterior periodo, a partir de mediados de los 1990, sin cambios en la oscilación térmica diaria al igualarse las tendencias de las máximas y de las mínimas (Hartmann et al., 2013)<sup>[14]</sup>, si bien las diferencias regionales y las incertidumbres asociadas a esta variable son aparentes.

Figura 35: Evolución de las tendencias de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas en ventanas móviles de 30 años para la España peninsular, Baleares, Ceuta y Melilla según los datos en rejilla 1961-2018. Las líneas gruesas y finas representan tendencias significativas y no significativas al 5 %, respectivamente.

### 5.3.b Canarias

En la Figura 36 se ha representado en color azul la evolución de las temperaturas medias anuales en el periodo 1961-2018 correspondientes a la zona de Canarias, y en línea roja discontinua la tendencia lineal obtenida por ajuste de mínimos cuadrados.

Analizando visualmente la serie, cuyo comportamiento se describió en el apartado 5.1.b, se aprecia a grandes rasgos una tendencia general creciente en el conjunto del periodo 1961-2018. Con un detalle mayor, se observa una tendencia decreciente durante los años 1960 y comienzos de los 1970, con un mínimo absoluto en 1972, que coincide con el observado en la zona de la península ibérica. A partir de esa fecha se aprecia una tendencia general creciente, muy marcada durante la segunda mitad de los años 1970 y comienzos de los 1980 y más gradual a partir de entonces, con

un breve periodo frío a comienzos de los años 1990, también observado en la zona de la España peninsular.

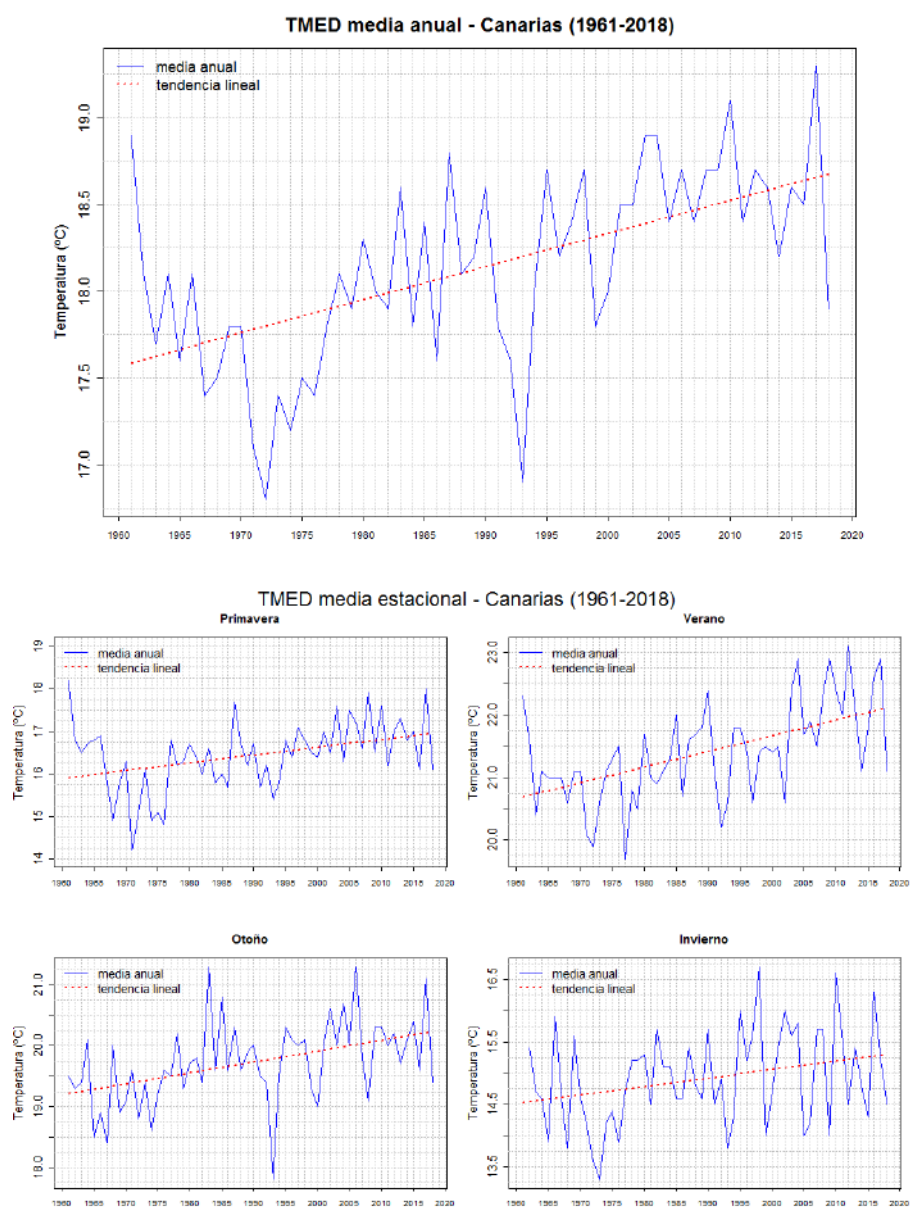

Figura 36: Evolución de la temperatura media anual y estacional para Canarias según los datos en rejilla 1961-2018.

La tendencia en la temperatura media anual para el periodo 1961-2018 es de 0,19 °C/decenio (ver [Tabla 9](#)), resultando significativa al 1 % con un p-valor muy bajo, por lo que es altamente improbable que se trate simplemente de un fenómeno aleatorio. El verano es la estación que más ha contribuido al calentamiento en el periodo 1961-2018, con una tendencia de 0,25 °C/decenio, significativa al 1 %, seguida de la primavera y el otoño, ambas con tendencias de 0,18 °C/decenio y también significativas al 1 %. El invierno presenta una tendencia menor, de 0,14 °C/decenio, y significativa solo al 5 %.

Tabla 9: Tendencias de la temperatura media para Canarias en el periodo 1961-2018 a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %).

La tendencia obtenida para la temperatura anual media, de 0,19 °C/decenio, resulta ligeramente inferior a la obtenida en la zona de la península ibérica (0,21 °C/decenio), evidenciando una mayor influencia oceánica, y ligeramente mayor que la tendencia global estimada a partir de los conjuntos de datos globales NOAA/GISTEMP y HadCRUT4 para el periodo 1961-2018, de 0,17 °C/decenio y 0,15 °C/decenio, respectivamente (ver [ANEXO A.1](#)).

Tabla 10: Tendencias de la temperatura media para Canarias por decenios a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %).

Analizando las tendencias por periodos de referencia de 30 años ([Tabla 10](#)), durante el periodo 1961-1990 no se observan tendencias significativas en las temperaturas medias anuales y estacionales salvo en los otoños, que presentan una tendencia de 0,37 °C/decenio, significativa al 1 %.

Las tendencias del periodo 1971-2000 en Canarias, aunque elevadas, son menores que en la zona peninsular, mostrando un valor de 0,30 °C/decenio en la temperatura media anual, significativo al 1 %, y valores de 0,45 °C/decenio, 0,36 °C/decenio y 0,31 °C/decenio para la primavera, el invierno y el verano, respectivamente, significativos todos ellos al 5 %.

A diferencia de lo que ocurría en la zona de la península ibérica, la temperatura media anual en Canarias muestra una tendencia creciente significativa al 1 % en el periodo 1981-2010, de 0,27 °C/decenio, debida a un aumento marcado de las temperaturas de primavera y verano.

También en el periodo incompleto 1991-2018 se observa tendencia creciente en la temperatura media anual, significativa en este caso al 5 % pero no al 1 %, debida nuevamente a un aumento de las temperaturas de primavera y verano.

En cuanto a las temperaturas medias anuales de las máximas y de las mínimas (Figura 37), destaca la existencia de una tendencia mucho más marcada en las mínimas, de 0,28 °C/decenio, que en las máximas, de tan solo 0,11 °C/decenio, ambas significativas al 1 % (ver Tabla 11), resultando por tanto una disminución del rango térmico diario a lo largo del periodo 1961-2018 en Canarias.

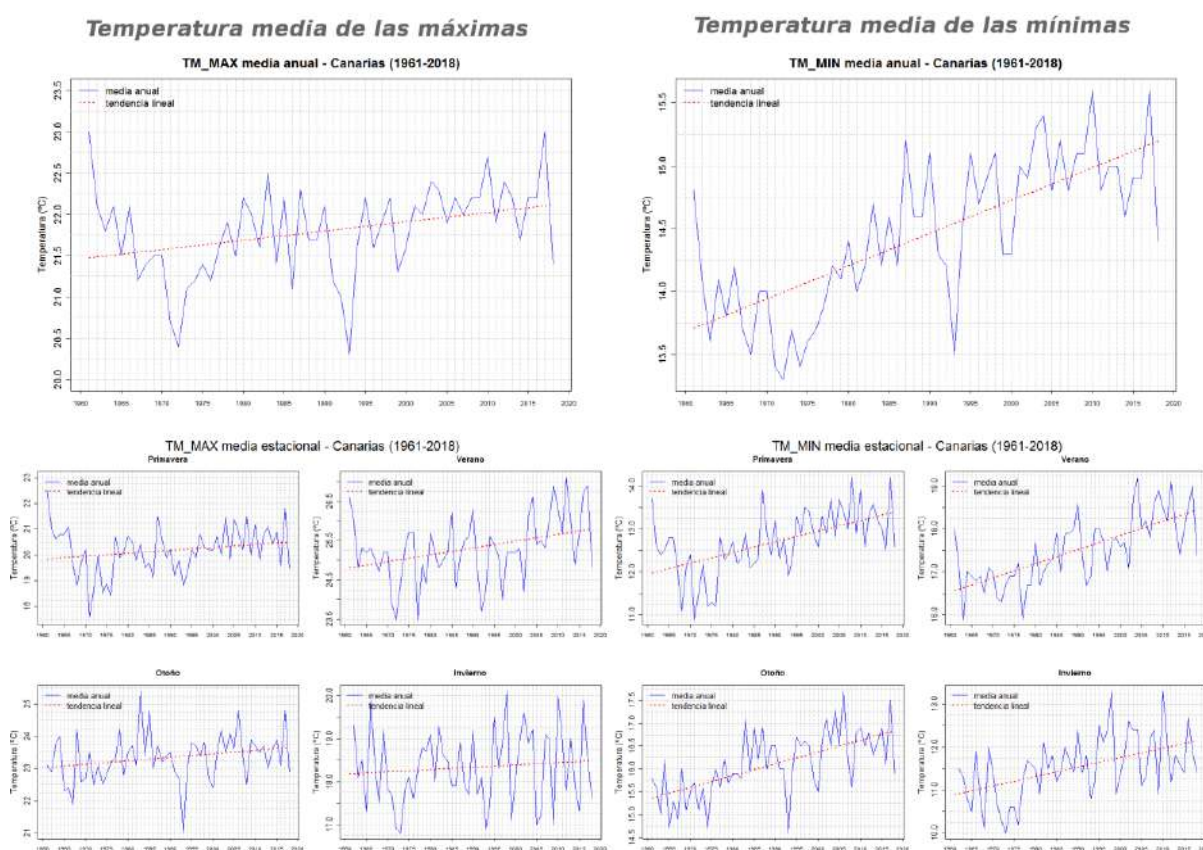

Figura 37: Evolución de la temperatura media anual y estacional de las máximas (izda.) y de las mínimas (dcha.) para Canarias según los datos en rejilla 1961-2018.

Tabla 11: Tendencias de la temperatura media de las máximas (izda.) y de las mínimas (dcha.) para Canarias en el periodo 1961-2018 a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %).

La temperatura media de las mínimas presenta tendencias significativas al 1 % en todas las estaciones del año, destacando el verano con 0,33 °C/decenio. La media de las máximas, en cambio, solo presenta una tendencia significativa al 1 % en el verano (0,17 °C/decenio), y al 5 % en el otoño (0,11 °C/decenio).

Tabla 12: Tendencias de la temperatura media de las máximas (arriba) y de la temperatura media de las mínimas (abajo) para Canarias por decenios a partir de los datos en rejilla (en negrita las tendencias significativas al 5 % pero no al 1 %, en negrita y cursiva las significativas al 1 %).

En el análisis de tendencias de las temperaturas estacionales por periodos de referencia de 30 años (Tabla 12), respecto a la temperatura media de las máximas, en el periodo 1961-1990 solo se observa una tendencia significativa al 5 % en otoño. En el resto de los periodos se encuentran algunas tendencias positivas significativas, destacando la de la temperatura media de las máximas estivales del periodo incompleto 1991-2018 (0,63 °C/decenio), significativa al 1 %. Respecto a la temperatura media de las mínimas, se observan más tendencias positivas significativas, destacando la de primavera en los periodos 1971-2000 y 1981-2010 y las estivales de todos los periodos, siendo todas ellas significativas al 1 %.

Por último, para evaluar de forma más precisa la evolución de las tendencias en Canarias a lo largo del periodo de estudio, se ha representado gráficamente (Figura 38) un análisis de las tendencias

en ventanas móviles de 30 años para la temperatura media anual, la temperatura media anual de las máximas y la temperatura media anual de las mínimas en el periodo 1961-2018.

Durante la mayor parte del periodo estudiado las tendencias son sensiblemente mayores en las mínimas que en las máximas, resultado que coincide con trabajos previos para las islas de Tenerife (Martín et al., 2012)<sup>[20]</sup> y Gran Canaria (Luque et al., 2014)<sup>[19]</sup>. Se observa un aumento de las tendencias de las máximas y las mínimas al comienzo del periodo de estudio hasta alcanzar ambas un máximo en el periodo 1969-1998, a partir del cual las tendencias disminuyen. Sin embargo, mientras que en la temperatura media de las mínimas este descenso se mantiene hasta el final del periodo de estudio, en el caso de la temperatura media de las máximas se observa en los últimos años un marcado aumento, de forma que la diferencia en las tendencias móviles de 30 años de las mínimas y de las máximas se reduce progresivamente y llega a invertirse en el periodo 1984-2013, siendo a partir de entonces ligeramente mayor la tendencia de las máximas que la de las mínimas.

Figura 38: Evolución de las tendencias de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas en ventanas móviles de 30 años para Canarias según los datos en rejilla (1961-2018). Las líneas gruesas y finas representan tendencias significativas y no significativas al 5 %, respectivamente.

## 5.4 Anomalías de temperatura de las series anuales y mensuales

Como complemento del análisis de tendencias anterior, se han representado los gráficos de las anomalías respecto del periodo de referencia completo más reciente (1981-2010) de las series anuales y mensuales de temperatura obtenidas a partir de los datos en rejilla para las dos zonas de estudio. Estos gráficos facilitan la visualización de las tendencias, así como la detección de los años con temperaturas especialmente anómalas.

### 5.4.a España peninsular, Baleares, Ceuta y Melilla

El primer año del periodo analizado, 1961, fue muy cálido, con una anomalía de la temperatura media anual de  $+0,5\text{ }^{\circ}\text{C}$  respecto de la media 1981-2010 (ver [Figura 39](#)). A partir de 1962 se observa un largo periodo con anomalías negativas que se extiende hasta 1982, con un mínimo en 1972, año en el que la anomalía de la temperatura media anual respecto de la media 1981-2010 quedó por debajo de  $-1,5\text{ }^{\circ}\text{C}$ . Durante los años 1980 y 1990 se alternaron las anomalías negativas y positivas, aunque con una tendencia general creciente en las anomalías. En los años 2000 se observa un predominio de las anomalías térmicas positivas, si bien en cuatro años de esta década hubo anomalías anuales ligeramente negativas, evidenciándose una disminución en el ritmo de calentamiento de las décadas anteriores. Por último, en los años transcurridos de la década del 2010 predominan claramente las anomalías positivas, habiéndose alcanzado los valores más altos de la serie en los años 2017 y 2015, respectivamente.

Destaca el elevado rango de valores que presentan las anomalías de la temperatura media de las máximas en comparación con las de la temperatura media de las mínimas: mientras que las anomalías de las máximas oscilan entre  $-2,0\text{ }^{\circ}\text{C}$  (año 1972) y  $+1,6\text{ }^{\circ}\text{C}$  (año 2017), con un rango por tanto de  $3,6\text{ }^{\circ}\text{C}$ , las de las mínimas van desde  $-1,3\text{ }^{\circ}\text{C}$  (años 1972 y 1973) a  $+0,9\text{ }^{\circ}\text{C}$  (año 2014), siendo su rango de tan solo  $2,2\text{ }^{\circ}\text{C}$ .

En la [Tabla 13](#) se muestra una clasificación de los meses, estaciones y años con una anomalía de la temperatura media más alta y más baja tomando como referencia el periodo 1981-2010. En la [Tabla 14](#) se muestra una lista ordenada de los quince meses con anomalías de la temperatura media más cálidas y más frías, referidas también al periodo 1981-2010. Como se observa en la tabla, seis de los diez meses con una anomalía más cálida son meses del siglo XXI, perteneciendo cinco de ellos al decenio incompleto 2011-2018, mientras que ninguno de los quince meses con una anomalía más fría son meses del presente siglo.

En las [Tablas 15 y 17](#) se muestra la misma información para la temperatura media de las máximas, y en las [Tablas 16 y 18](#) la correspondiente a la temperatura media de las mínimas.

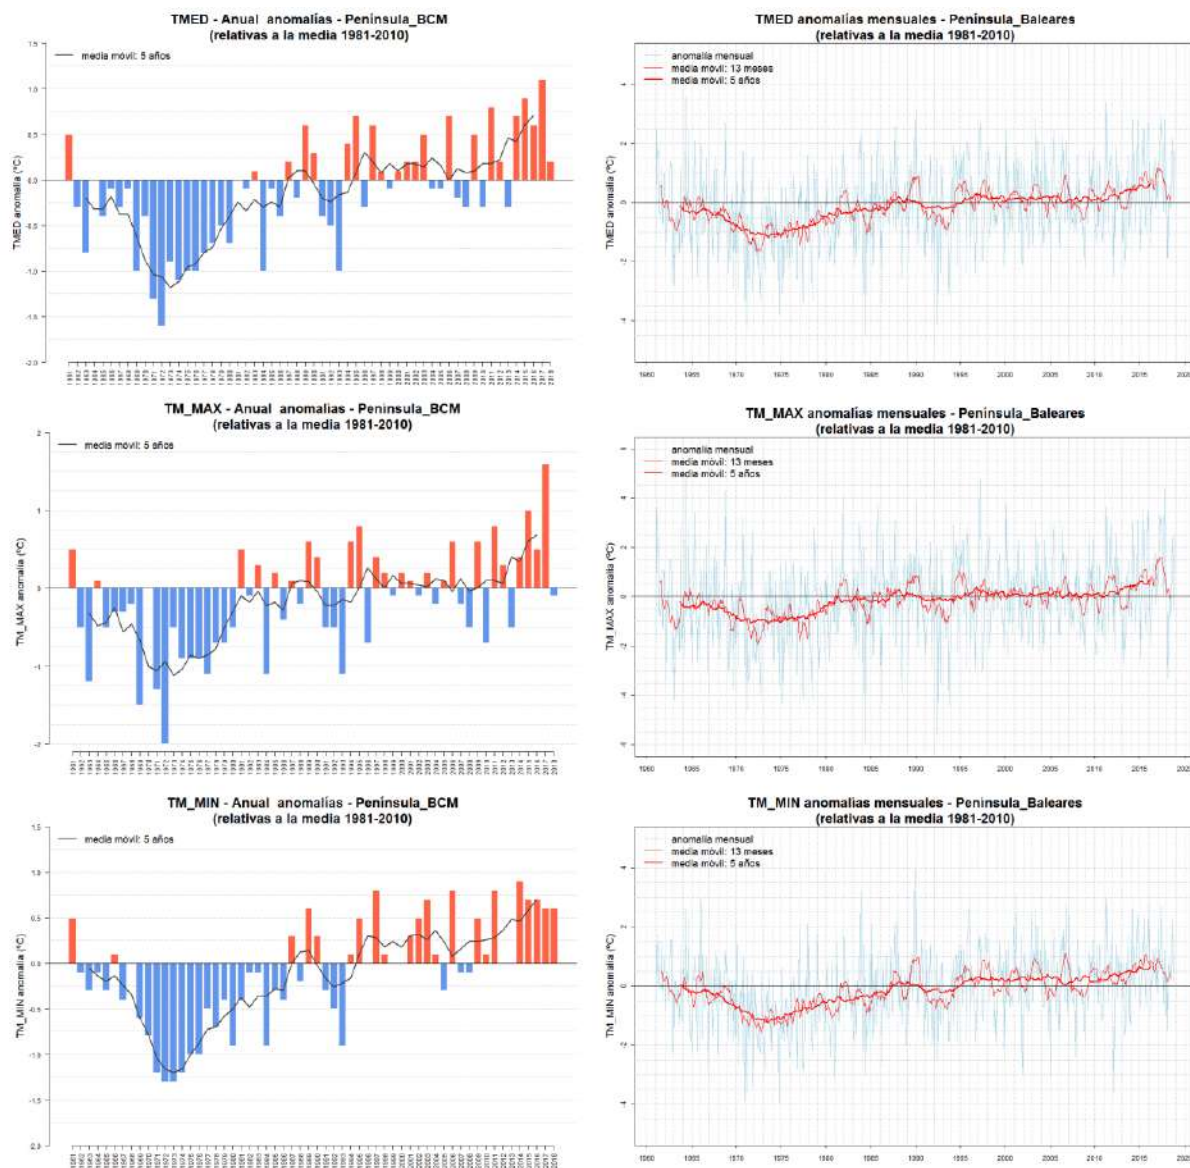

Figura 39: Anomalías de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas para la España peninsular, Baleares, Ceuta y Melilla, a partir de los datos en rejilla (periodo de referencia 1981-2010). En las gráficas de la izquierda se representan las series anuales y sus medias móviles en 5 años, y en las de la derecha las series mensuales junto con las medias móviles de 13 meses y de 5 años.

2002	12	4.7	2.4	1970	3	1.1	-2.8

Tabla 18: Meses con anomalía más cálida/fría para la temperatura media de las mínimas de la España peninsular, Baleares, Ceuta y Melilla en el periodo 1961-2018 (periodo de referencia: 1981-2010).

### 5.4.b Canarias

En Canarias el periodo estudiado comienza con un año 1961 que presenta una elevada anomalía positiva (Figura 40), mucho más marcada en las temperaturas máximas que en las mínimas, tras el cual se observa un periodo prolongado de anomalías negativas en la temperatura media que abarca hasta 1982. En el resto de los años 1980 y en los 1990 se alternan las anomalías positivas y negativas, destacando una sucesión de cuatro años seguidos con anomalías negativas, tanto en las máximas como en las mínimas, en la primera mitad de los años 1990. Durante los años 2000 y 2010 predominan claramente las anomalías positivas frente a las negativas, siendo 2018 y en menor medida 2014 los únicos años de este periodo que presentan anomalías negativas significativas respecto de la media 1981-2010.

Al igual que en el caso de la zona de la España peninsular, Baleares, Ceuta y Melilla, las anomalías de la temperatura media de las máximas presentan un mayor rango de valores que las de la temperatura media de las mínimas.

A continuación se muestra una clasificación de las anomalías más cálidas/frías para la temperatura media (Tablas 19 y 20), la temperatura media de las máximas (Tablas 21 y 22) y la temperatura media de las mínimas (Tablas 23 y 24).

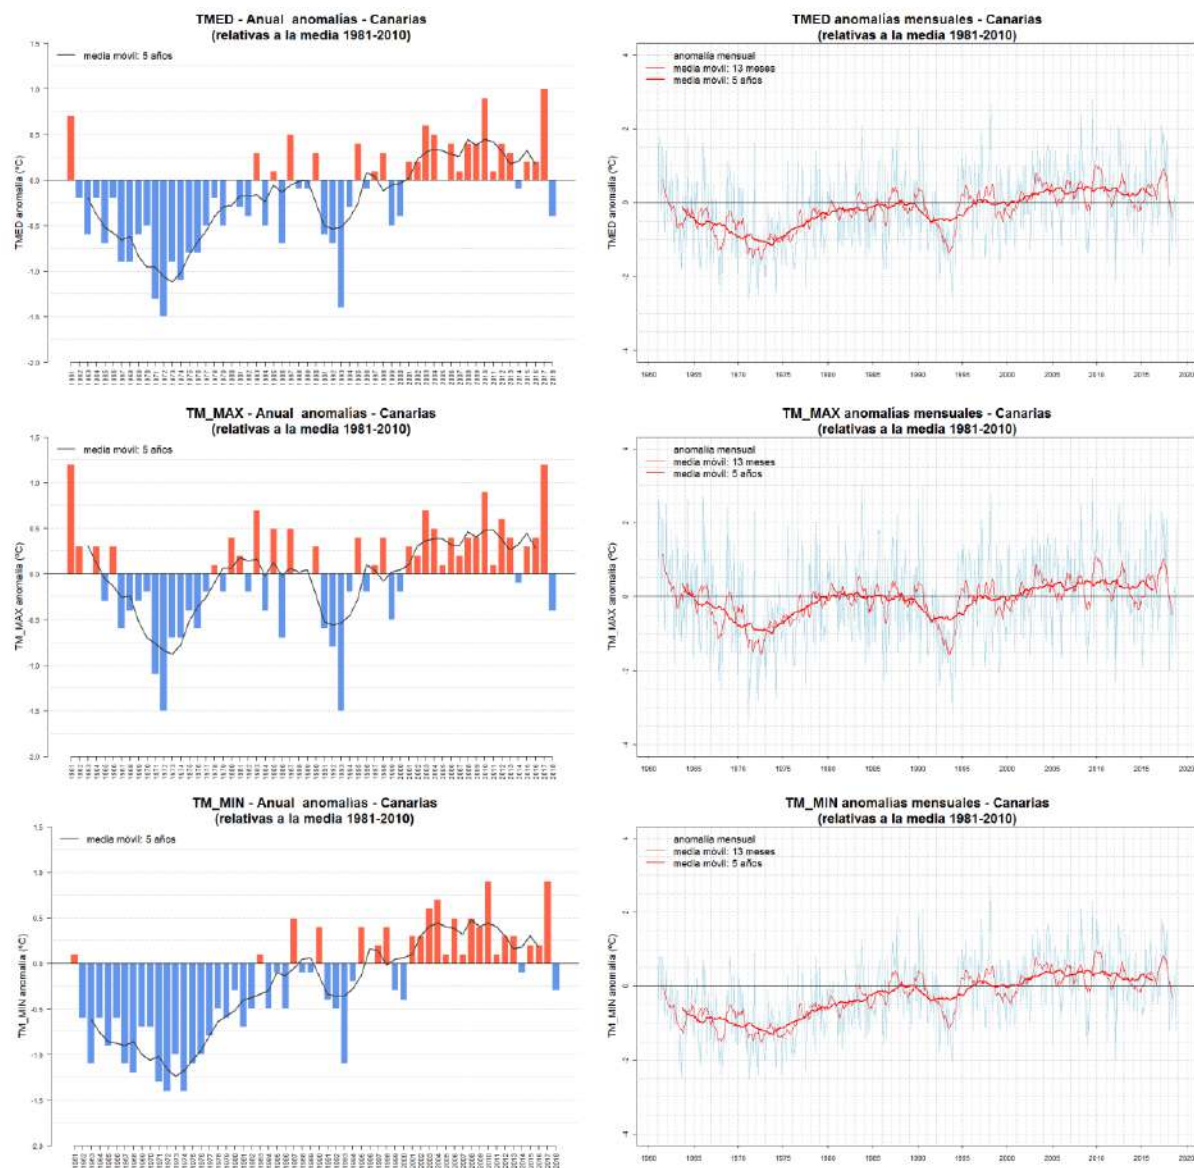

Figura 40: Anomalías de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas para Canarias, a partir de los datos en rejilla (periodo de referencia 1981-2010). En las gráficas de la izquierda se representan las series anuales y sus medias móviles en 5 años, y en las de la derecha las mensuales junto con las medias móviles de 13 meses y de 5 años.

TEMPERATURA MEDIA

## 5.5 Gráficos de barras de anomalías térmicas

Por último, se han representado para las dos zonas geográficas las anomalías anuales y estacionales de la temperatura media, temperatura media de las máximas y temperatura media de las mínimas respecto del periodo de referencia 1981-2010 utilizando los gráficos de barras diseñados por Ed Hawkins. En estos gráficos se representan las anomalías ordenadas cronológicamente utilizando franjas de colores llamativos, de forma que resulta sencillo e intuitivo ver la existencia de tendencias en la temperatura. Estos gráficos se diseñaron para la divulgación científica del cambio climático entre el público no especializado con el objeto de aumentar su concienciación sobre el calentamiento global (Windhager et al., 2019)<sup>[30]</sup>.

Se han empleado tonos azules para los valores por debajo de la media del periodo de referencia y tonos rojos para los que quedan por encima, con una escala para las anomalías comprendida entre -2,2°C y +2,2°C.

Se muestran a continuación los gráficos correspondientes a la España peninsular, Baleares, Ceuta y Melilla ([Figuras 41 y 42](#)) y Canarias ([Figuras 43 y 44](#)).

En el [ANEXO E](#) se pueden consultar además los gráficos por comunidades autónomas. No se han representado los gráficos para las ciudades autónomas de Ceuta y de Melilla ya que, como se comentó en el apartado correspondiente a las estadísticas por territorios, las estadísticas que se obtienen para estos territorios y, por tanto, también los gráficos de barras de anomalías, pueden presentar resultados poco robustos ya que se han obtenido a partir de la interpolación espacial de un número muy reducido de estaciones que, además, han ido variando en el tiempo durante el periodo 1961-2018, por lo que no resultan adecuados para un estudio de tendencias.

## 5.5.a España peninsular, Baleares, Ceuta y Melilla

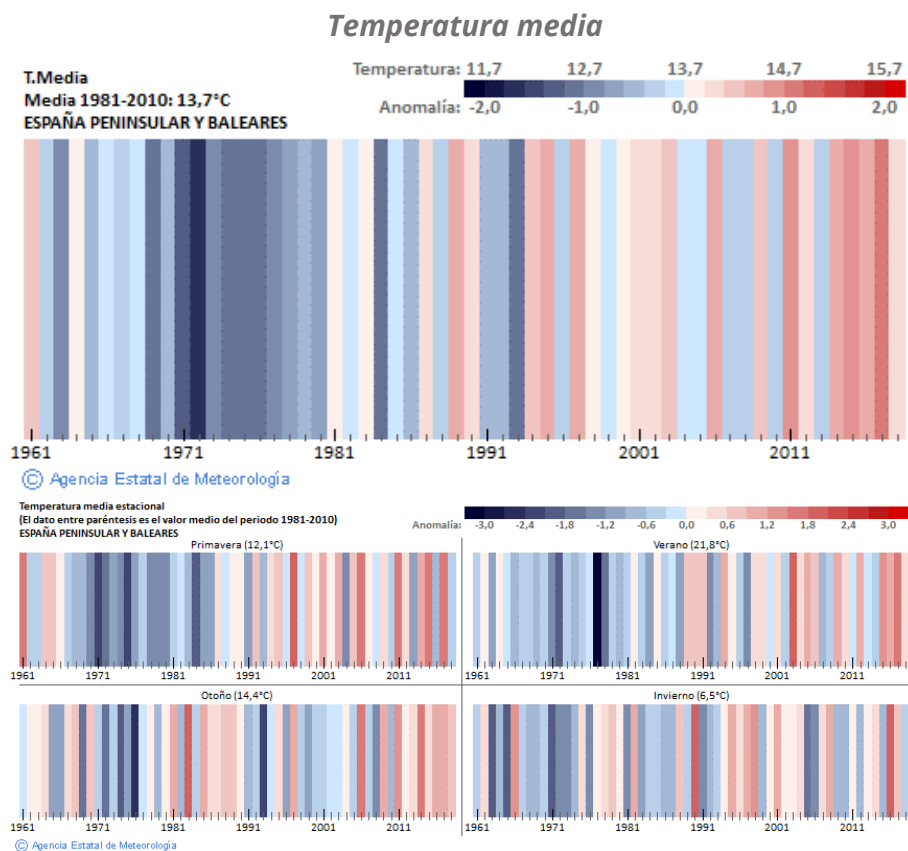

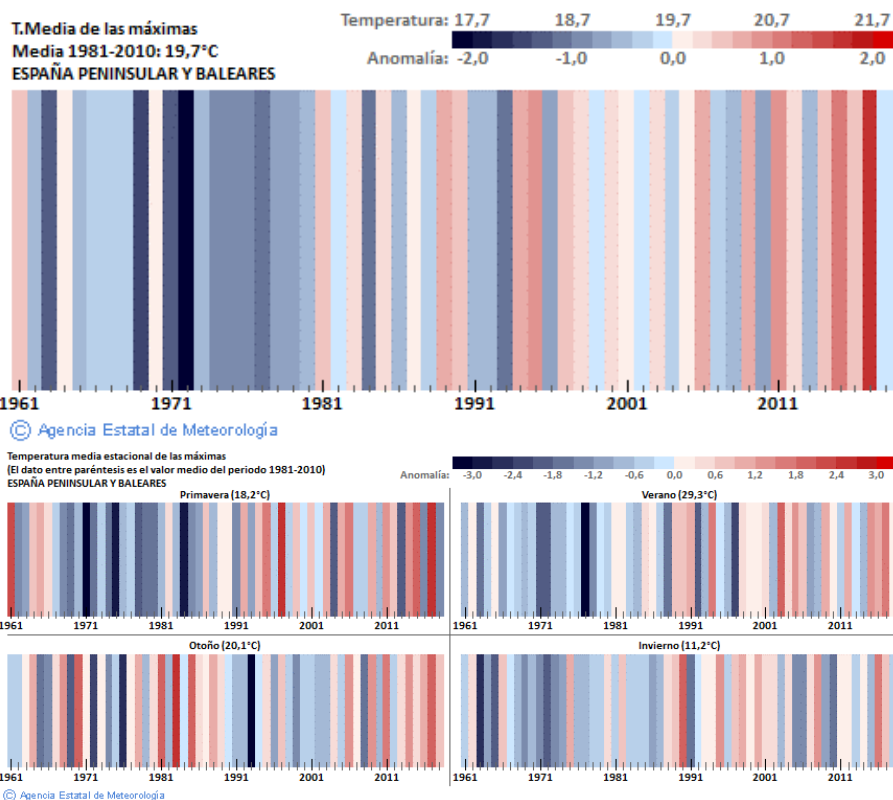

Figura 41: Gráfico de barras de anomalías de la temperatura media anual (arriba) y estacional (abajo) respecto del periodo 1981-2010 para la España peninsular, Baleares, Ceuta y Melilla.

### Temperatura media de las máximas

### Temperatura media de las mínimas

## ANEXO A Comparación con otras series de datos mundiales de temperatura

En este anexo se comparan las series de temperatura media obtenidas a partir de las rejillas con otras series relevantes a escala global y regional durante el periodo 1961-2018.

Entre ellas se incluye un conjunto de series globales y europeas analizadas por la Agencia Europea de Medioambiente (EEA), consistentes en series de datos de temperatura combinada sobre la superficie terrestre y los océanos.

Se analizan además otras series de datos de temperatura solo de tierra de los proyectos NOAA global Temp v5, desarrollado por la NOAA, y CRUTEM4, del Met Office Hadley Centre y la Climatic Research Unit de la Universidad de East Anglia.

### A.1 Series globales de temperatura media anual

En el estudio “Global and European temperature” realizado por la Agencia Europea de Medioambiente (EEA, 2019b)<sup>[11]</sup> se evalúan diversas series globales de anomalías de temperatura media anual respecto del periodo preindustrial 1850-1899, elaboradas con datos de tierra y océano combinados.

Para facilitar su comparación con las series de temperatura obtenidas a partir de las rejillas, las series de anomalías del estudio de la EEA se han referenciado al periodo de referencia actual (1981-2010) sumándoles la diferencia entre los valores medios de ambos periodos, y se han limitado al periodo de estudio 1961-2018 utilizado en la presente publicación. En la [Figura A.1](#) se han representado estas series de anomalías junto con la serie de anomalías de la temperatura anual media para la España peninsular, Ceuta y Melilla.

Los datos de las series globales representadas (EEA, 2019c)<sup>[12]</sup> proceden en su origen de diversas fuentes:

- HadCRUT4: serie de datos de temperatura global (tierra y océano) desarrollado conjuntamente por el Climatic Research Unit (University of East Anglia) y el Hadley Centre (UK Met Office).
- ERA5: producto de reanálisis del ECMWF (European Centre for Medium-Range Weather Forecasts) que abarca la superficie terrestre y oceánica .
- GISTEMP: Goddard Institute for Space Studies Surface Temperature Analysis (GISTEMP) conjunto de datos globales de tierra y océano proporcionado por la NASA (National Aeronautics and Space Administration).
- NOAA Global Temp: anomalías anuales de temperatura global de superficie (tierra y océano) elaboradas por la NOAA (National Oceanic and Atmospheric Administration).

En la [Tabla A.1](#) se muestran las tendencias de la serie de anomalías de temperatura media anual para varias de las series de datos representadas en la [Figura A.1](#).

Figura A.1: Comparación de las anomalías de la temperatura anual a partir de las rejillas para la España peninsular, Baleares, Ceuta y Melilla con diversas series de anomalías globales (tierra y océano) respecto del periodo de referencia 1981-2010.

Data-set	Global (1961-2018)	
	Tendencia	Kendall p-valor
HadCrut	$0.15 \pm 0.01$	$1.37 \times 10^{-16}$
NOAA	$0.17 \pm 0.01$	$1.39 \times 10^{-19}$
GISTEMP	$0.17 \pm 0.01$	$1.39 \times 10^{-19}$
Península, Baleares, C y M	$0.21 \pm 0.04$	$5.77 \times 10^{-06}$

Tabla A.1: Tendencias de las anomalías de temperatura anual según diversas series de datos globales y tendencia de la serie de la España peninsular, Baleares, Ceuta y Melilla para el período 1961-2018.

## A.2 Series de temperatura media anual en Europa

En el trabajo “Global and European temperature” (EEA, 2019b)<sup>[11]</sup> se estudia también la evolución de distintas series de anomalías de la temperatura media anual para el continente europeo tomando como referencia el periodo preindustrial 1850-1899.

Además de los conjuntos de datos descritos en el apartado anterior, se dispone también para la superficie terrestre europea de la serie de datos siguiente:

- E-OBS: series de valores de rejilla de temperatura diarios para Europa basados en los datos del proyecto ECA&D.

Al igual que en el caso de las series globales, se han adaptado las series europeas de anomalías del estudio de la EEA para referenciarlas al periodo de referencia actual 1981-2010 y se han limitado al periodo de estudio 1961-2018.

En la [Figura A.2](#) se han representado estas series de anomalías para Europa (EEA, 2019a)<sup>[10]</sup> junto con la de la serie de anomalías de la temperatura anual media para la España peninsular, Ceuta y Melilla.

En la [Tabla A.2](#) se muestran las tendencias de la serie de anomalías de temperatura media anual para algunas de las series de datos representadas en la [Figura A.2](#).

Figura A.2: Comparación de las anomalías de la temperatura media anual a partir de las rejillas para la España peninsular, Baleares, Ceuta y Melilla con diversas series de anomalías en Europa respecto del periodo de referencia 1981-2010.

Data-set	Europa (1961-2018)	
	Tendencia	Kendall p-valor
E-OBS	0.32 ± 0.04	5.82×10 <sup>-11</sup>
HadCrut	0.29 ± 0.03	4.58×10 <sup>-12</sup>
NOAA	0.29 ± 0.02	5.24×10 <sup>-13</sup>
GISSTEMP	0.29 ± 0.02	5.24×10 <sup>-13</sup>
Península, Baleares, C y M	0.21 ± 0.04	5.77×10 <sup>-06</sup>

Tabla A.2: Tendencias de las anomalías de temperatura anual según diversas series de datos para Europa y tendencia de la serie de la España peninsular, Baleares, Ceuta y Melilla para el período 1961-2018.

### A.3 Otras series de temperatura media anual sobre la superficie terrestre

En este apartado se analizan otras series de datos de temperaturas sobre la superficie terrestre a escala mundial, sin incluir datos de temperatura sobre la superficie de los océanos.

#### A.3.a NOAA Global Temp (v.5)

Se han utilizado las series de anomalías de temperatura correspondientes a la superficie terrestre elaboradas en el proyecto NOAA Global Temp V5 (Zhang et al., 2019a)<sup>[32]</sup>, en el cual se combinan datos de temperatura de superficie global de tierra y océano (Zhang et al., 2019b)<sup>[33]</sup>, para varias franjas de latitud terrestre.

Estas series de anomalías de temperatura media anual están referenciadas al periodo 1971-2000, por lo que en la [Figura A.3](#) todas las series se muestran referenciadas a ese periodo. Se representan las series de datos correspondientes a la superficie terrestre 90S90N (hemisferios norte y sur), 00N90N (hemisferio norte) y 30N60N para los años 1961-2018.

En la [Tabla A.3](#) se muestran las tendencias de la serie de anomalías de temperatura media anual para las series de datos representadas en la [Figura A.3](#).

*Figura A.3: Anomalías de la temperatura media anual de NOAA Global Temp v.5 sobre la superficie terrestre para varias franjas de latitud, y anomalías de la temperatura media anual a partir de las rejillas para la España peninsular, Baleares, Ceuta y Melilla respecto del periodo de referencia 1971-2000.*

NOAA Global Temp (1961-2018)		
Data-set	Tendencia	Kendall p-valor
90S90N	$0.26 \pm 0.01$	$1.66 \times 10^{-16}$
00N90N	$0.29 \pm 0.02$	$2.91 \times 10^{-16}$
30N60N	$0.29 \pm 0.02$	$4.65 \times 10^{-12}$
Península, Baleares, C y M	$0.21 \pm 0.04$	$5.77 \times 10^{-06}$

*Tabla A.3: Tendencias de las anomalías de temperatura anual sobre la superficie terrestre para distintas franjas de latitud según NOAA Global Temp y tendencia de la serie de la España peninsular, Baleares, Ceuta y Melilla para el periodo 1961-2018.*

### A.3.b CRUTEM4

CRUTEM4 es una serie de datos en rejilla de anomalías de la temperatura del aire sobre la superficie terrestre que surge de la colaboración entre el Met Office Hadley Centre y el Climatic Research Unit (University of East Anglia). Las anomalías están referidas al período 1961-1990, estando disponibles dos conjuntos de datos que abarcan todo el planeta y el hemisferio norte, respectivamente (Jones et al., 2012)<sup>[17]</sup>.

En la [Figura A.4](#) se representan estas series de datos para el periodo 1961-2018 conjuntamente con las anomalías de la temperatura media anual en la zona de la España peninsular, Baleares, Ceuta y Melilla obtenidas a partir de las rejillas de la presente publicación, referidas todas ellas al periodo de referencia 1961-1990.

En la [Tabla A.4](#) se muestran las tendencias de la serie de anomalías de temperatura media anual para las series de datos representadas en la [Figura A.4](#).

Figura A.4: Anomalías de la temperatura media anual de CRUTEM4 para el hemisferio norte y global, y anomalías de la temperatura media anual a partir de las rejillas para la España peninsular, Baleares, Ceuta y Melilla respecto del periodo de referencia 1961-1990.

CRUTEM 4 (1961-2018)		
Data-set	Tendencia	Kendall p-valor
90S90N	$0.23 \pm 0.01$	$1.12 \times 10^{-02}$
00N90N	$0.27 \pm 0.02$	$2.33 \times 10^{-02}$
Península, Baleares, C y M	$0.21 \pm 0.04$	$5.77 \times 10^{-06}$

Tabla A.4: Tendencias de las anomalías de temperatura anual sobre la superficie terrestre para el hemisferio norte y global según CRUTEM4 y tendencia de la serie de la España peninsular, Baleares, Ceuta y Melilla para el periodo 1961-2018.

## ANEXO B Tablas de temperatura media mensual y anual de la España peninsular, Baleares, Ceuta y Melilla (1961-2018)

*Tabla D.186: Estadísticas de temperatura media de las mínimas mensual y anual de la ciudad autónoma de Melilla.*

## ANEXO E Gráficos de barras de anomalías de temperatura por comunidades autónomas

### E.1 Andalucía

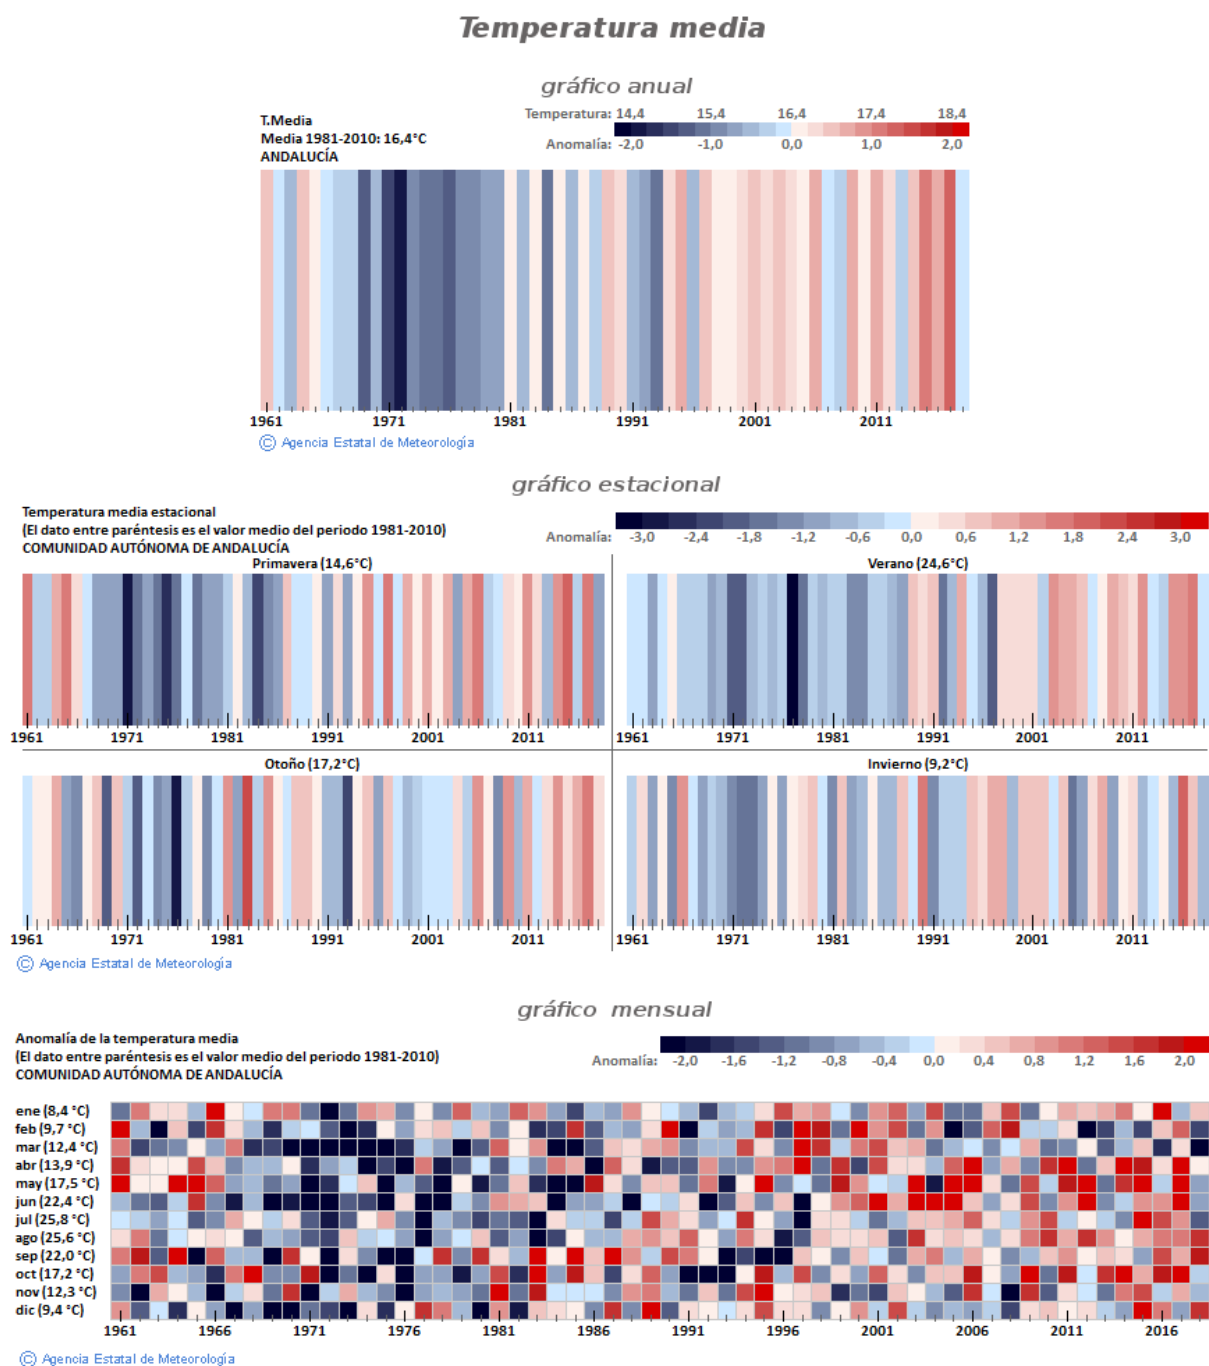

Figura E.1: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Andalucía.

## Temperatura media de las máximas

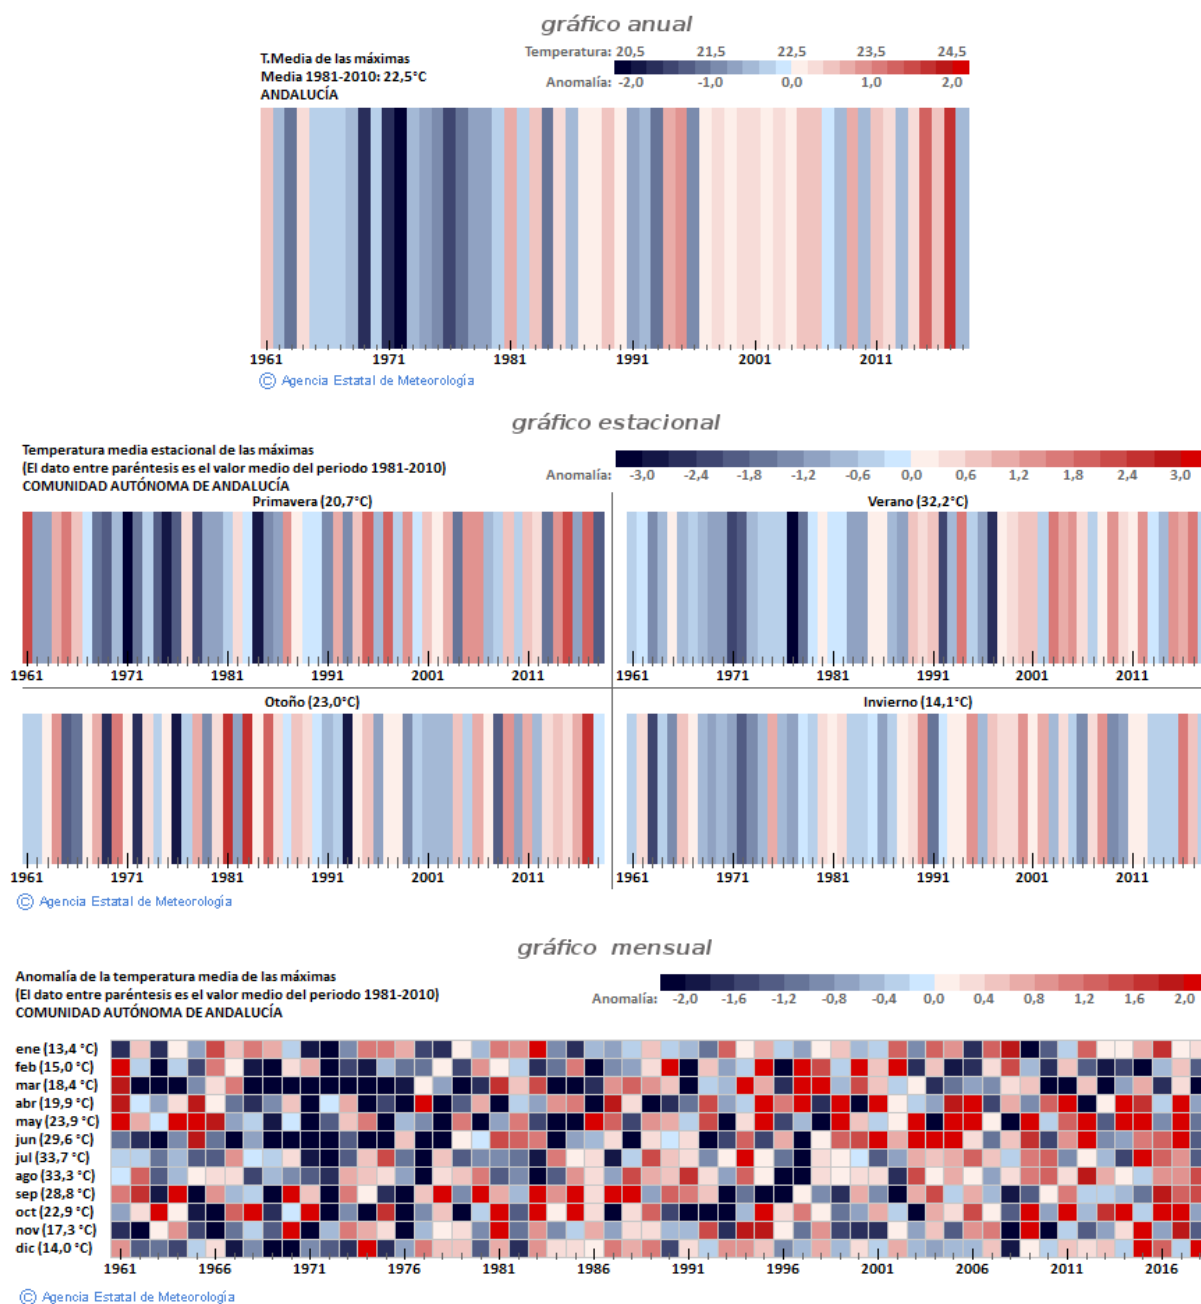

Figura E.2: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Andalucía.

## Temperatura media de las mínimas

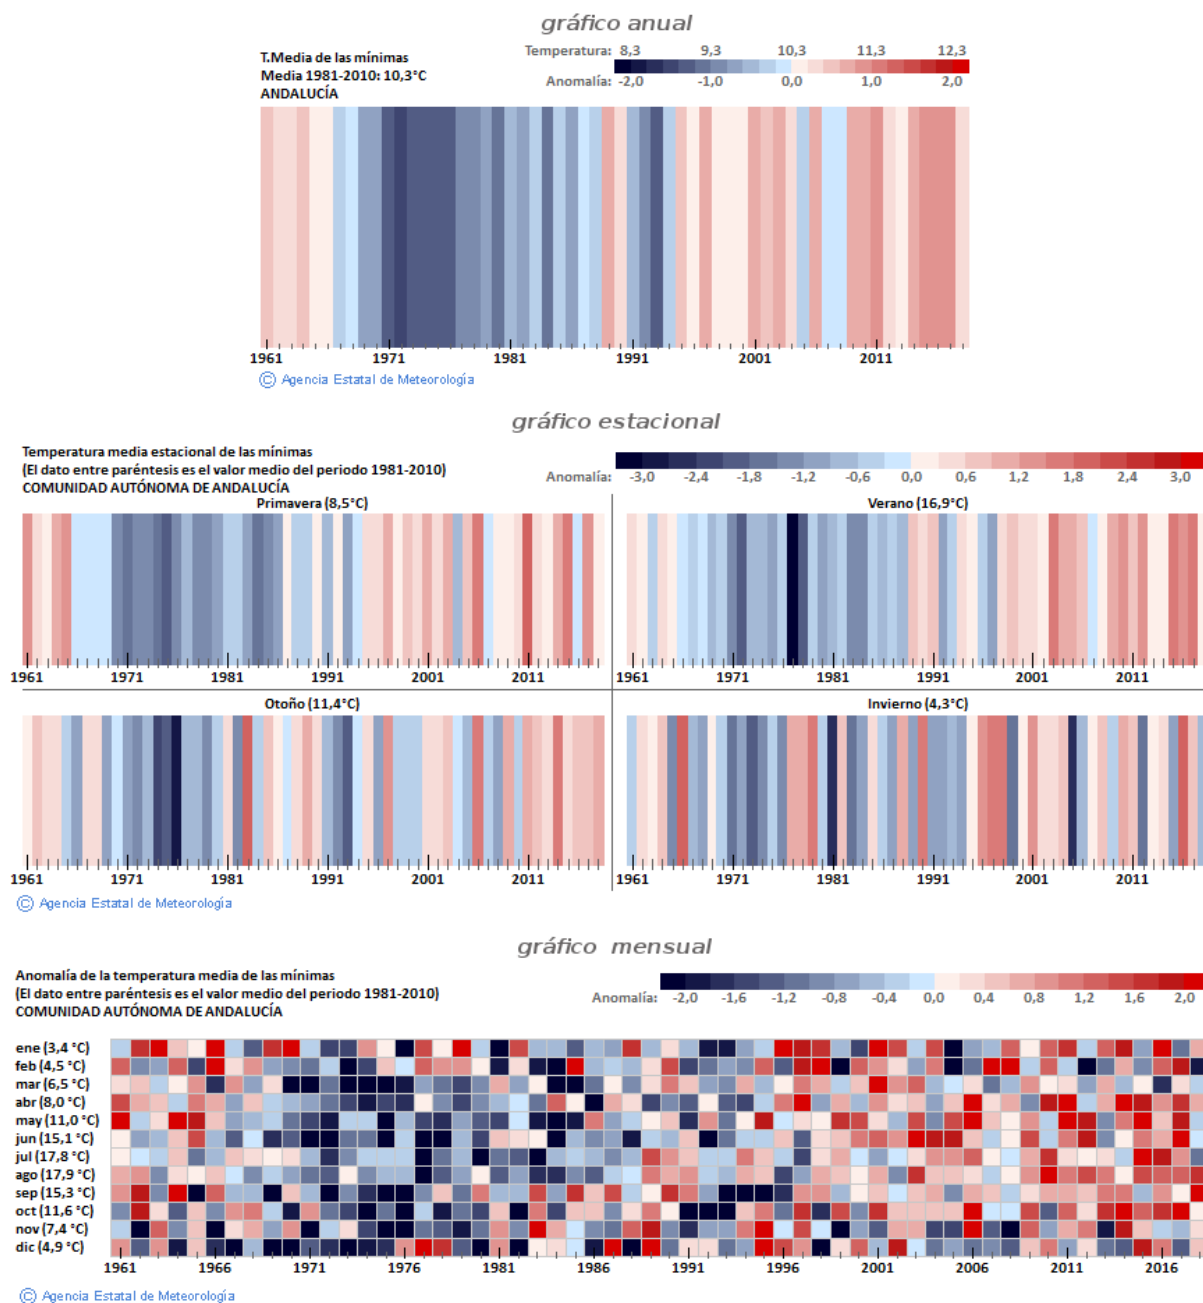

Figura E.3: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Andalucía.

## E.2 Aragón

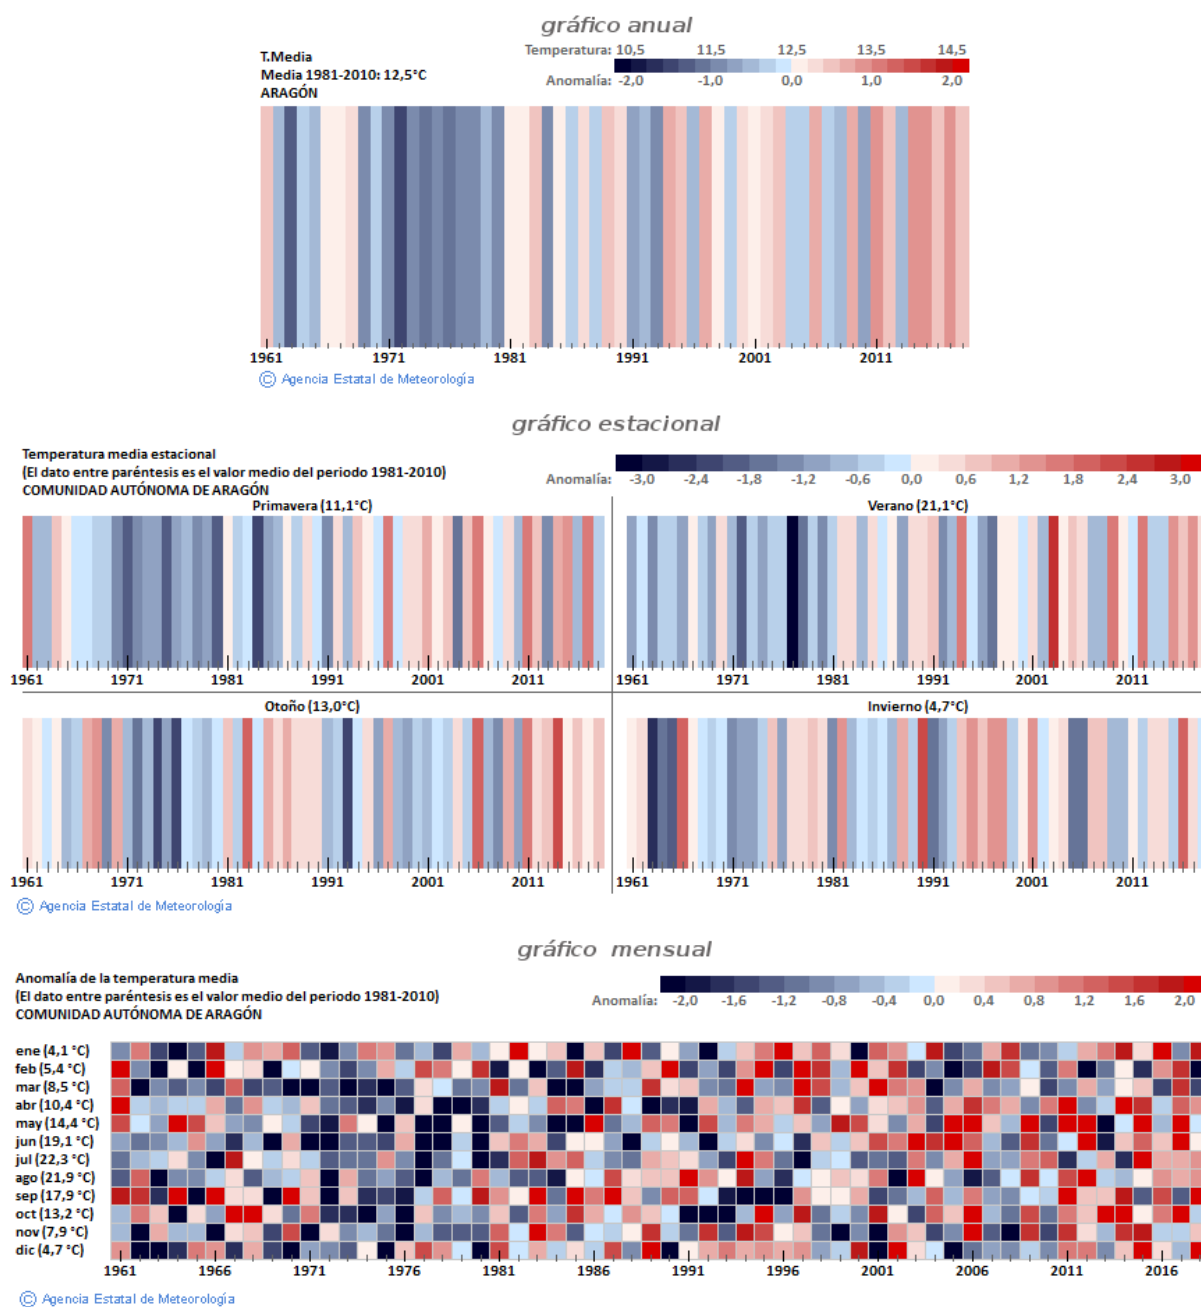

**Temperatura media**

Figura E.4: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Aragón.

## Temperatura media de las máximas

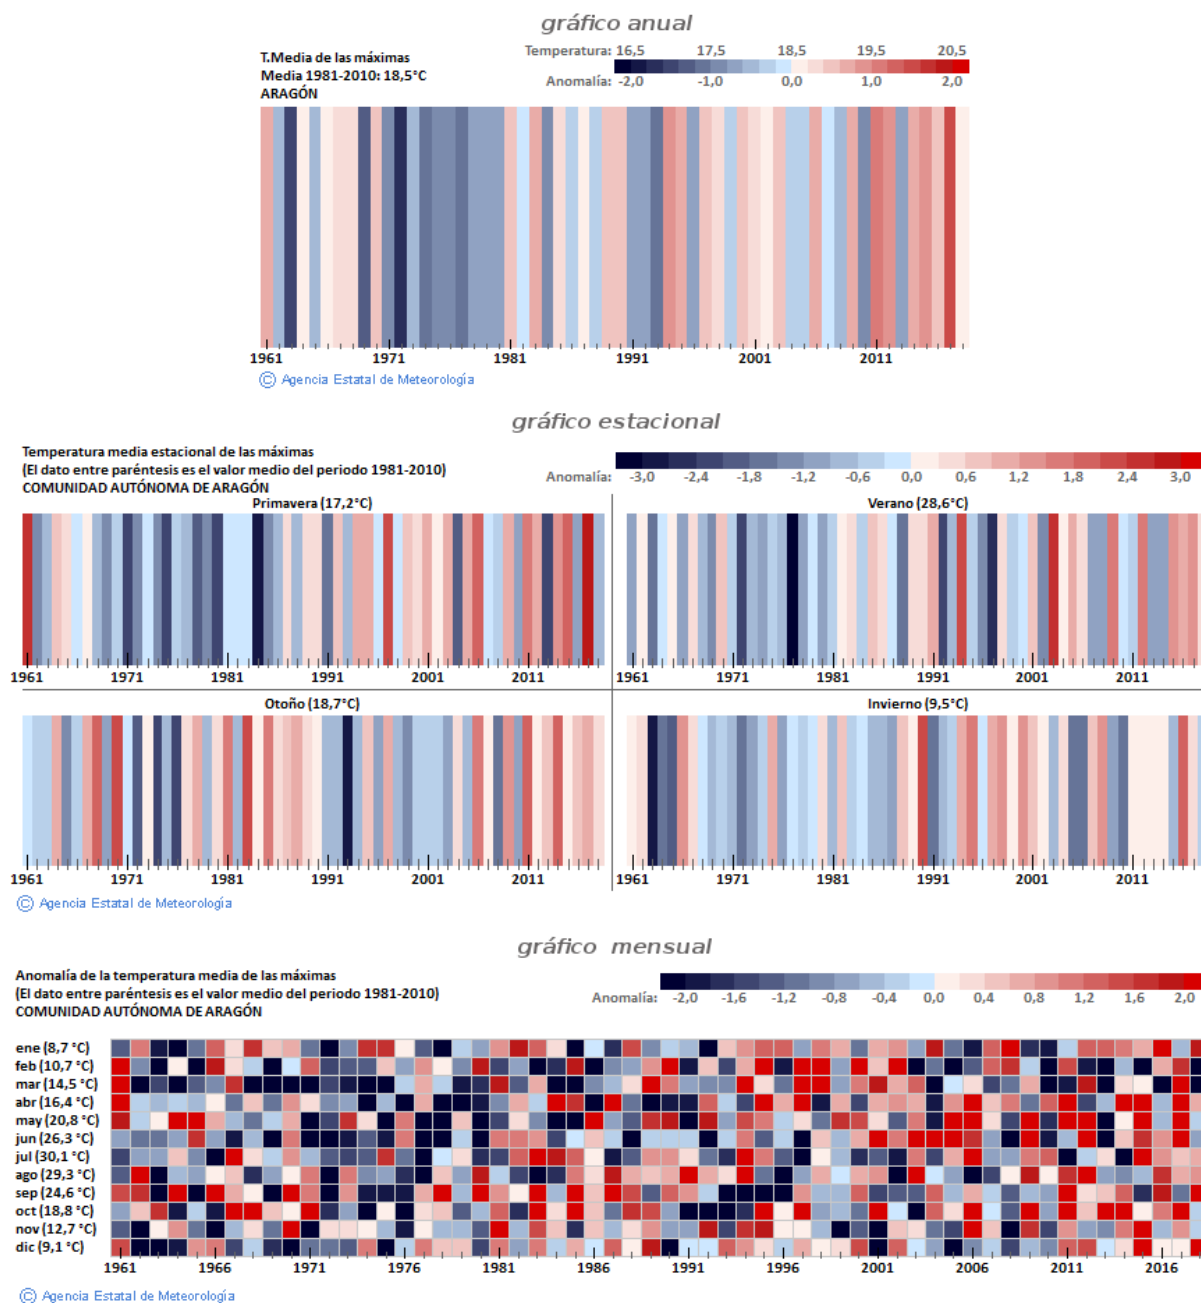

Figura E.5: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Aragón.

## Temperatura media de las mínimas

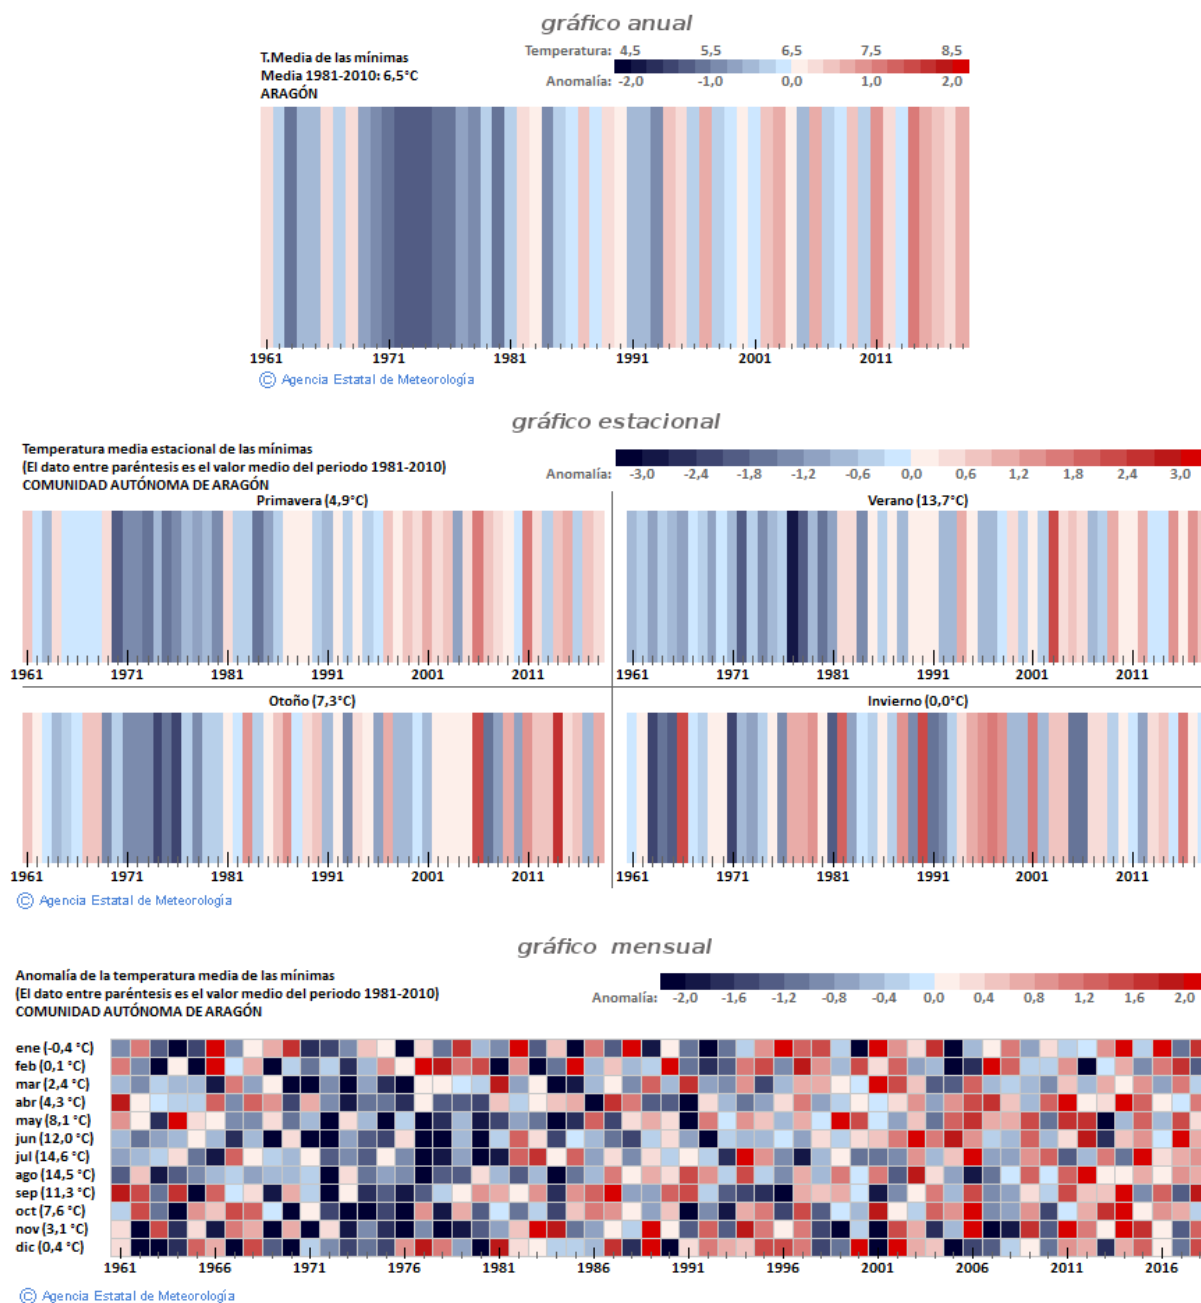

Figura E.6: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Aragón.

## E.3 Principado de Asturias

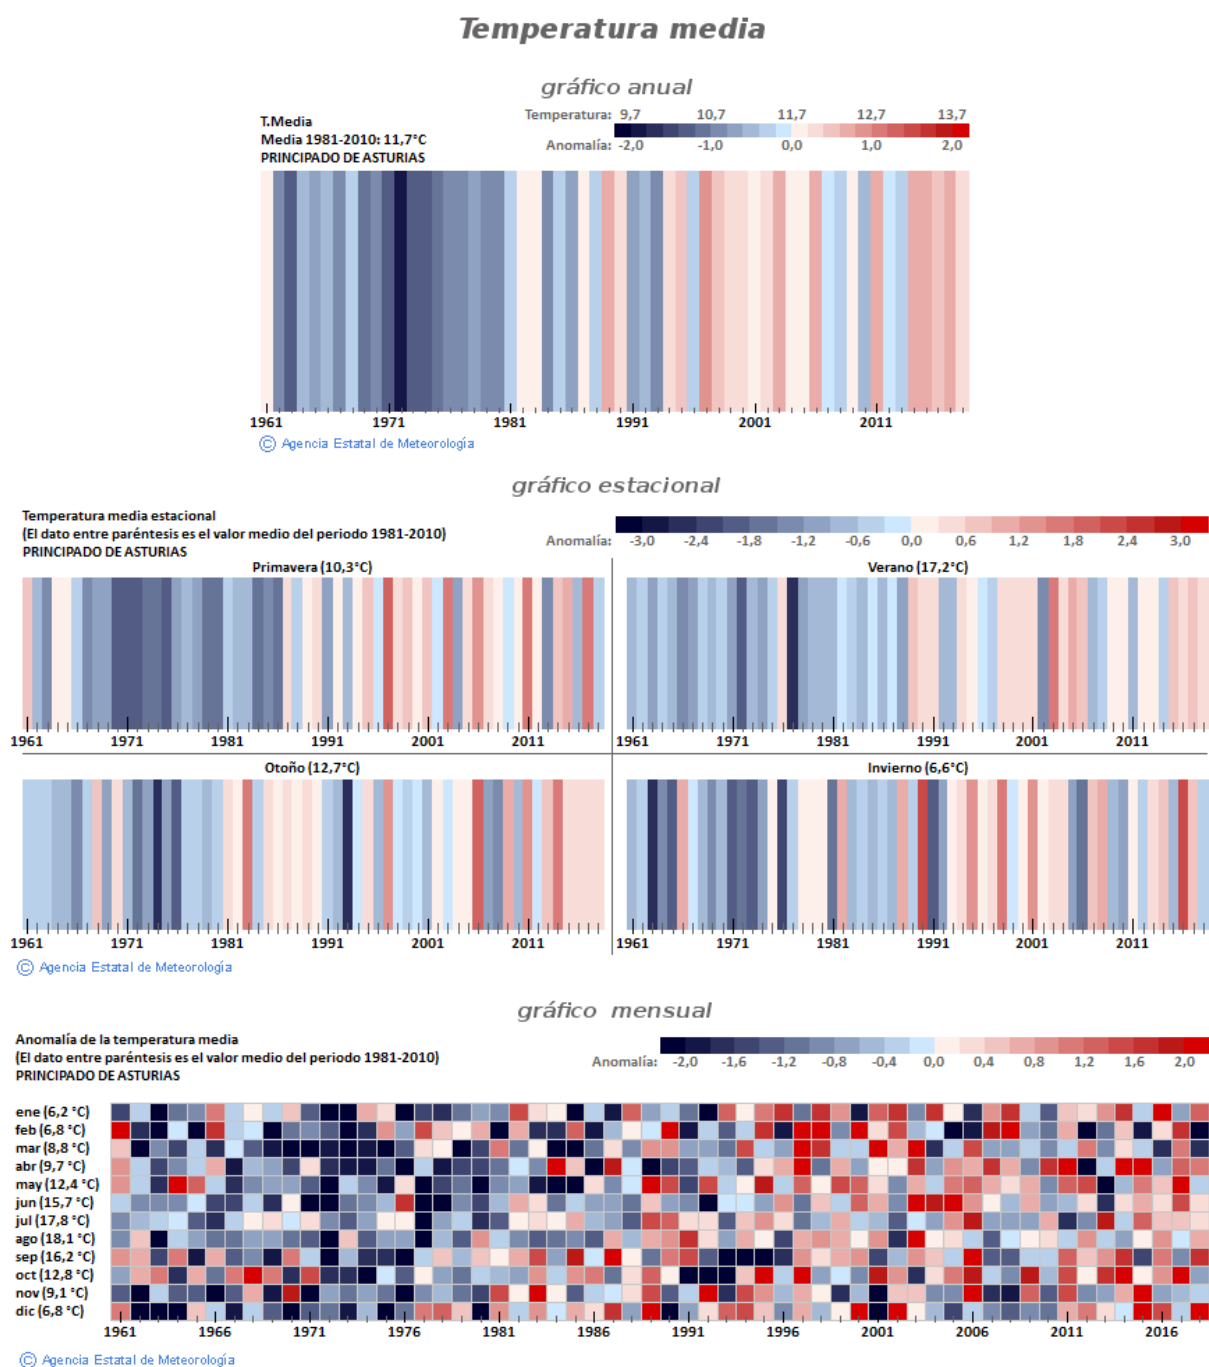

Figura E.7: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) del Principado de Asturias.

## Temperatura media de las máximas

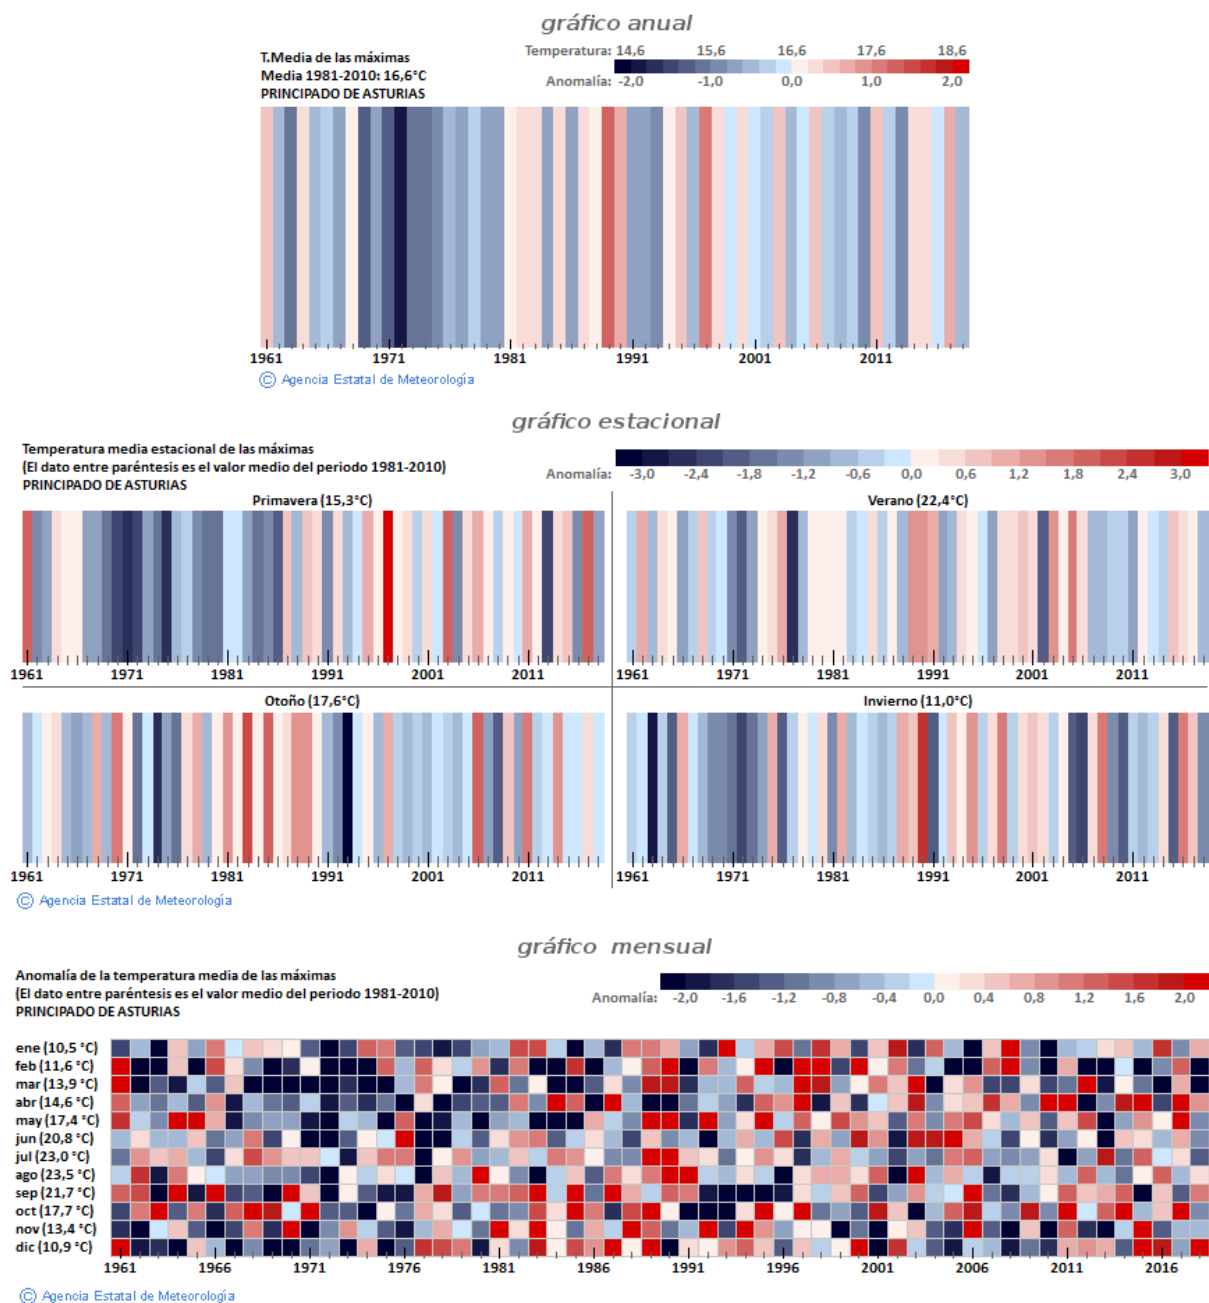

Figura E.8: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) del Principado de Asturias.

## Temperatura media de las mínimas

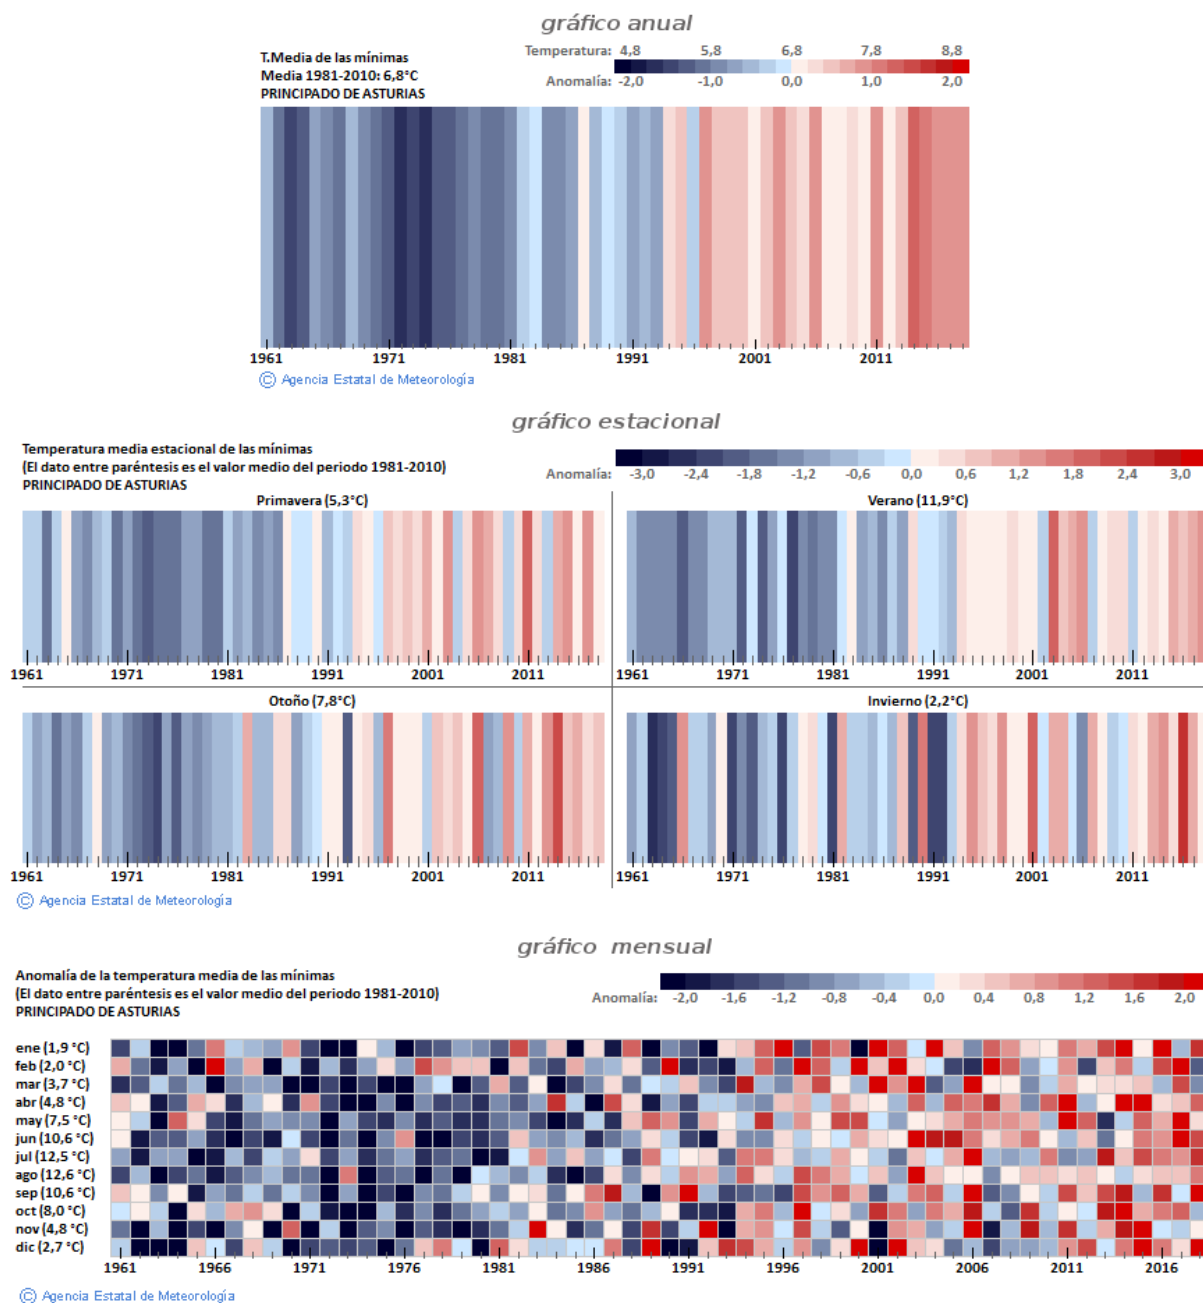

Figura E.9: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) del Principado de Asturias.

## E.4 Illes Balears

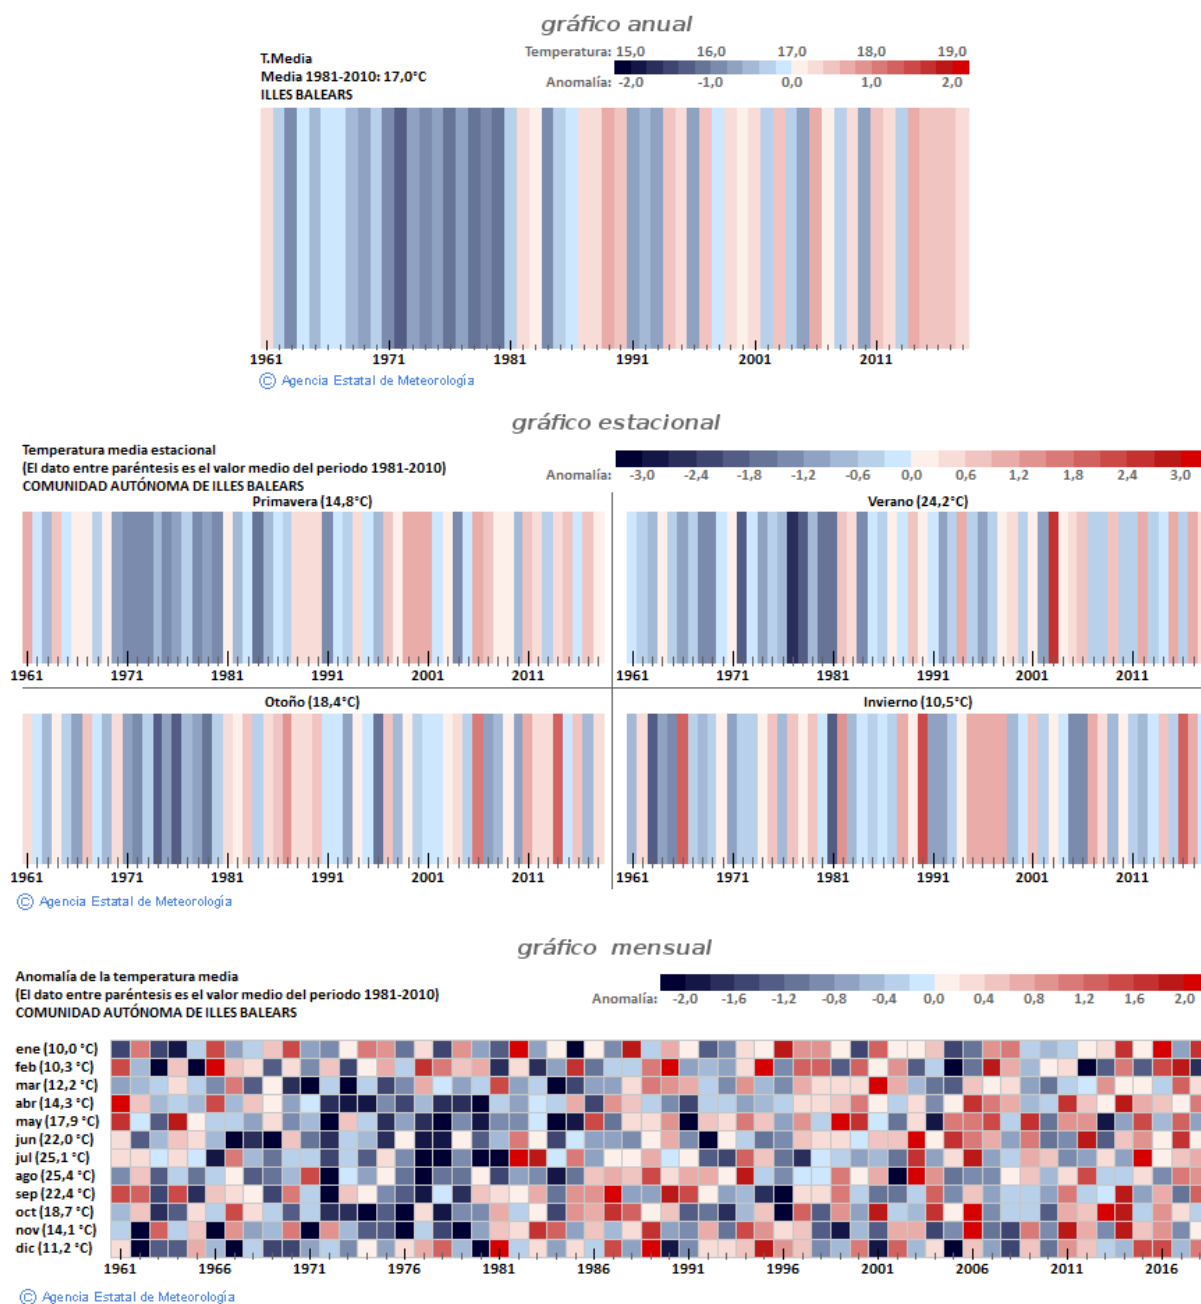

**Temperatura media**

Figura E.10: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de Illes Balears.

## Temperatura media de las máximas

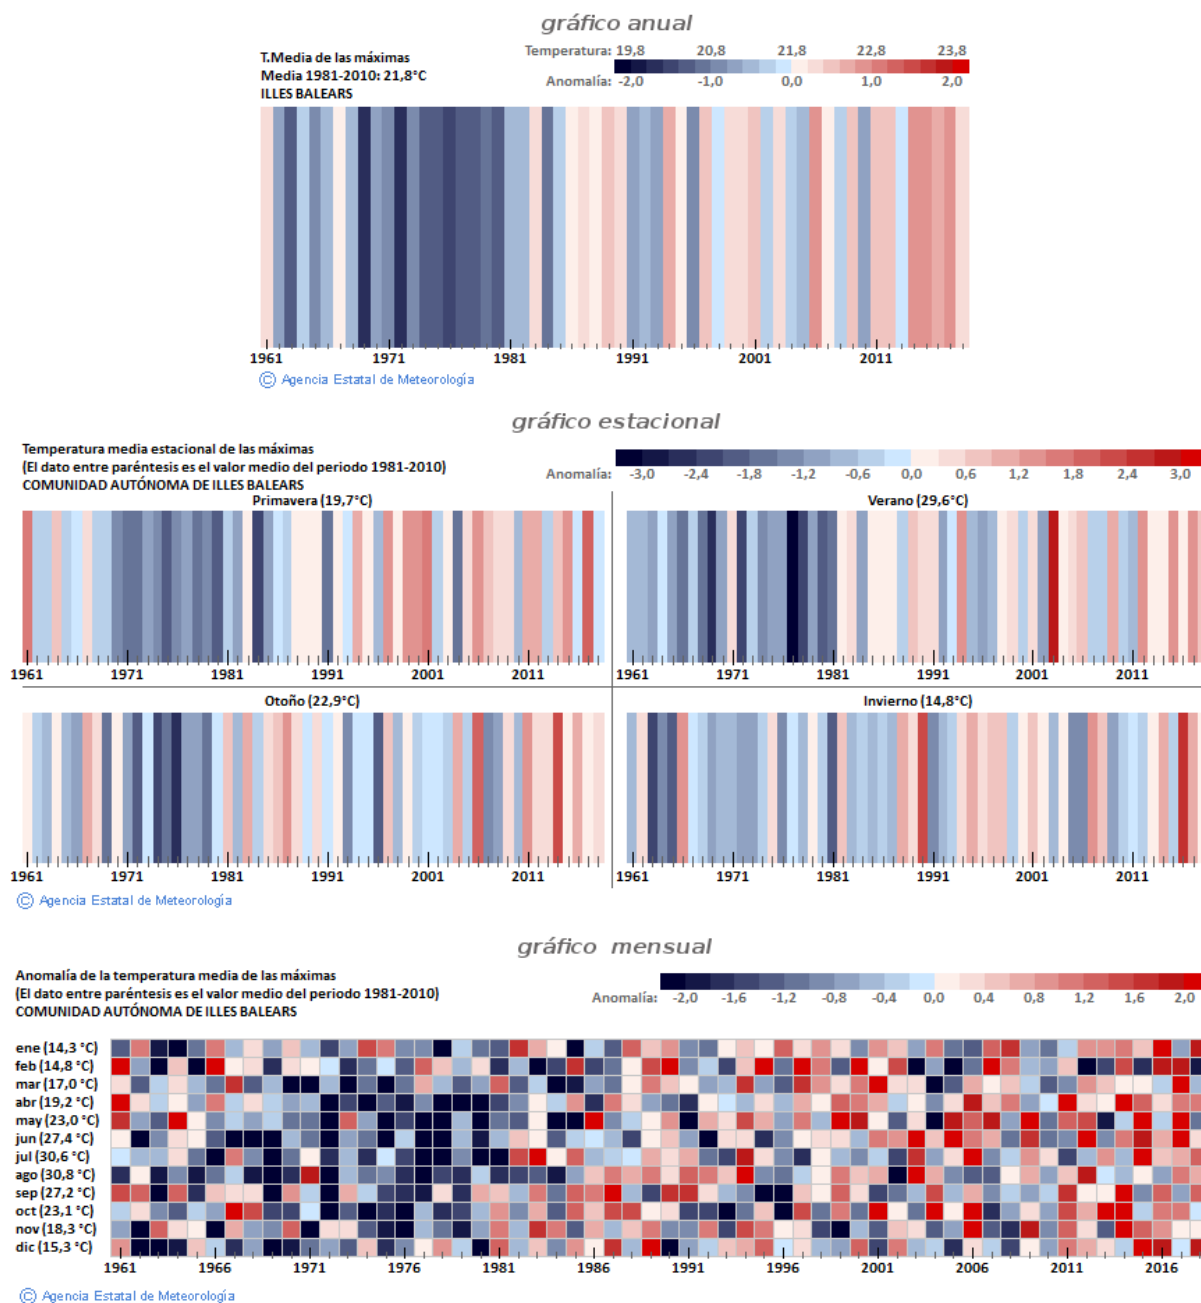

Figura E.11: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de Illes Balears.

## Temperatura media de las mínimas

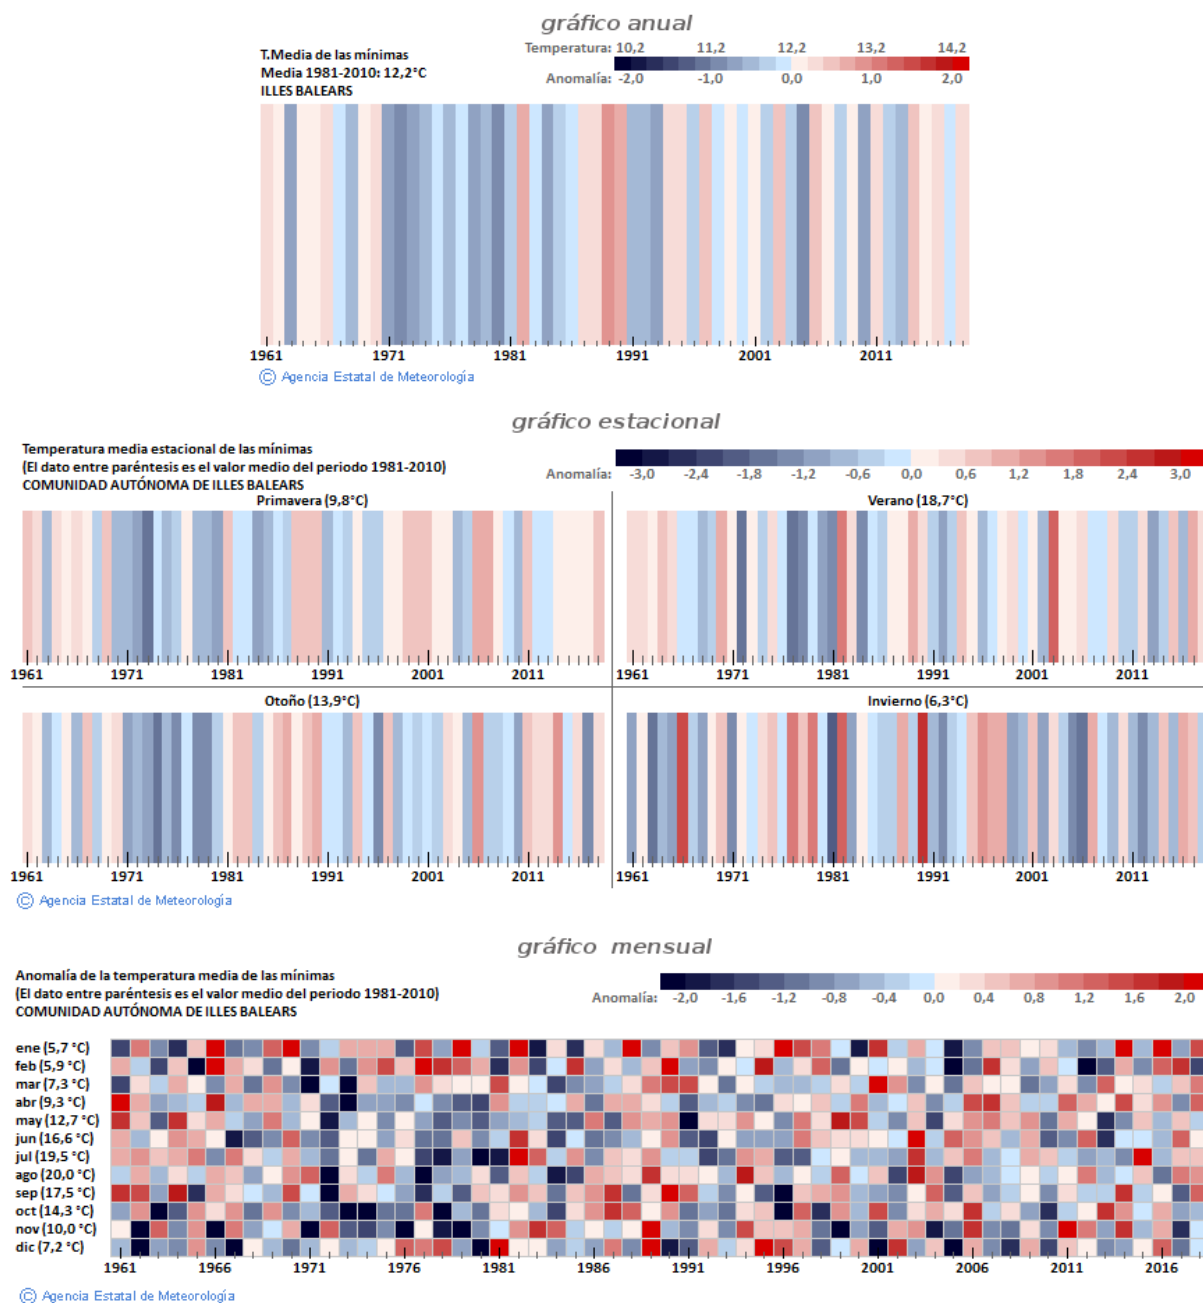

Figura E.12: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de Illes Balears.

## E.5 Canarias

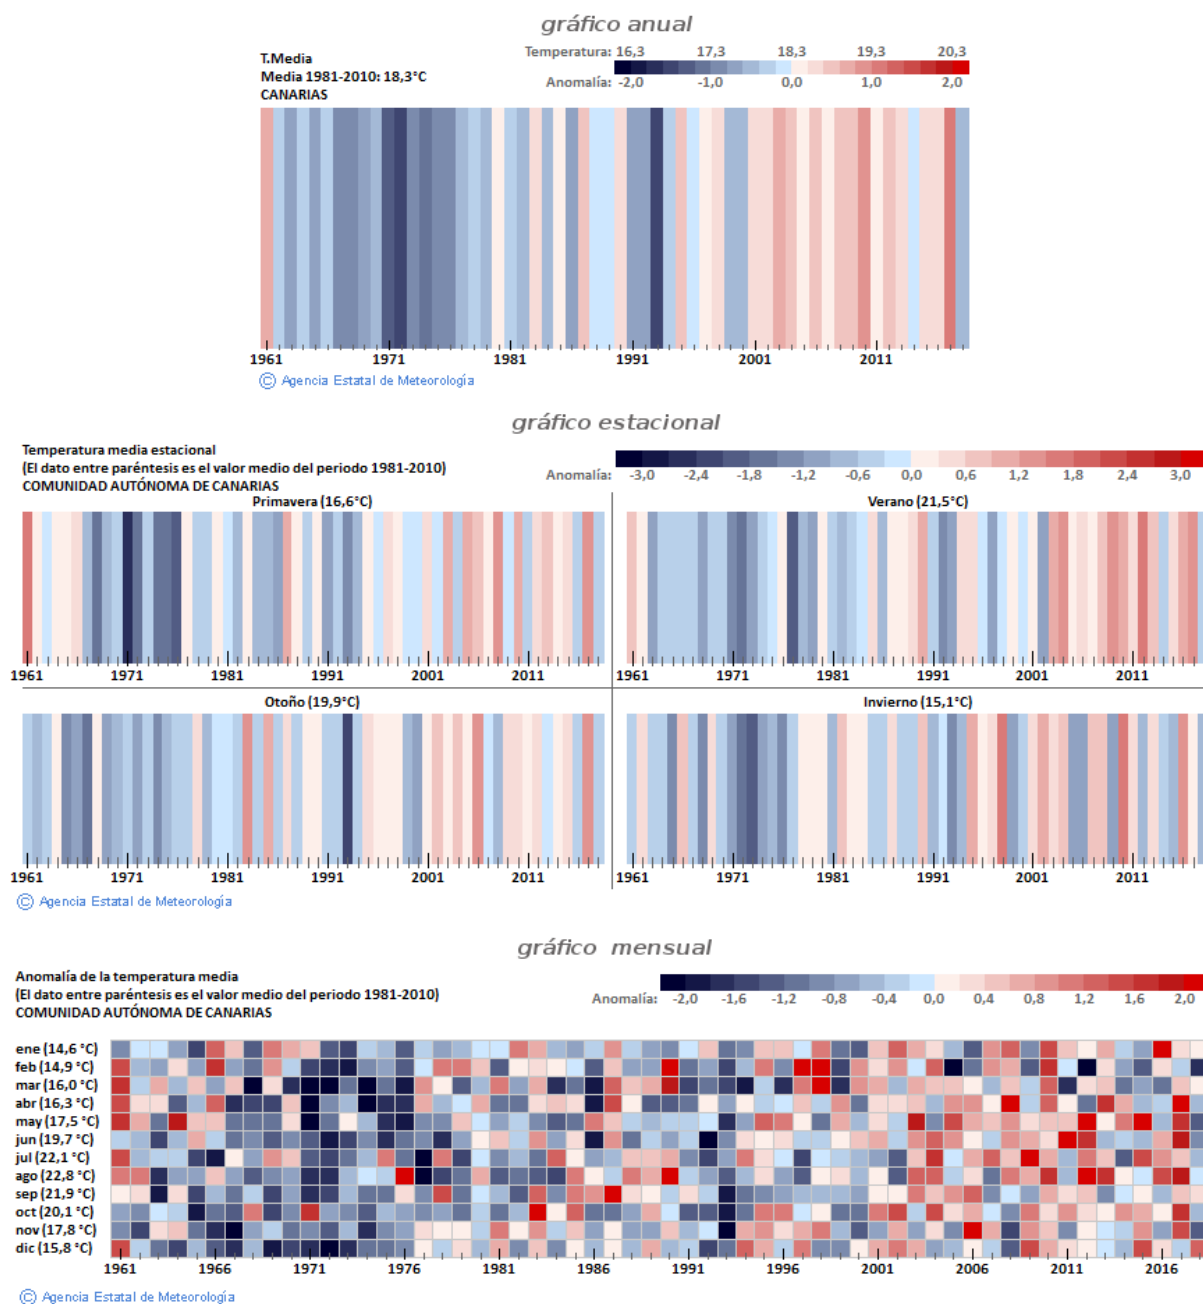

**Temperatura media**

Figura E.13: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Canarias.

## Temperatura media de las máximas

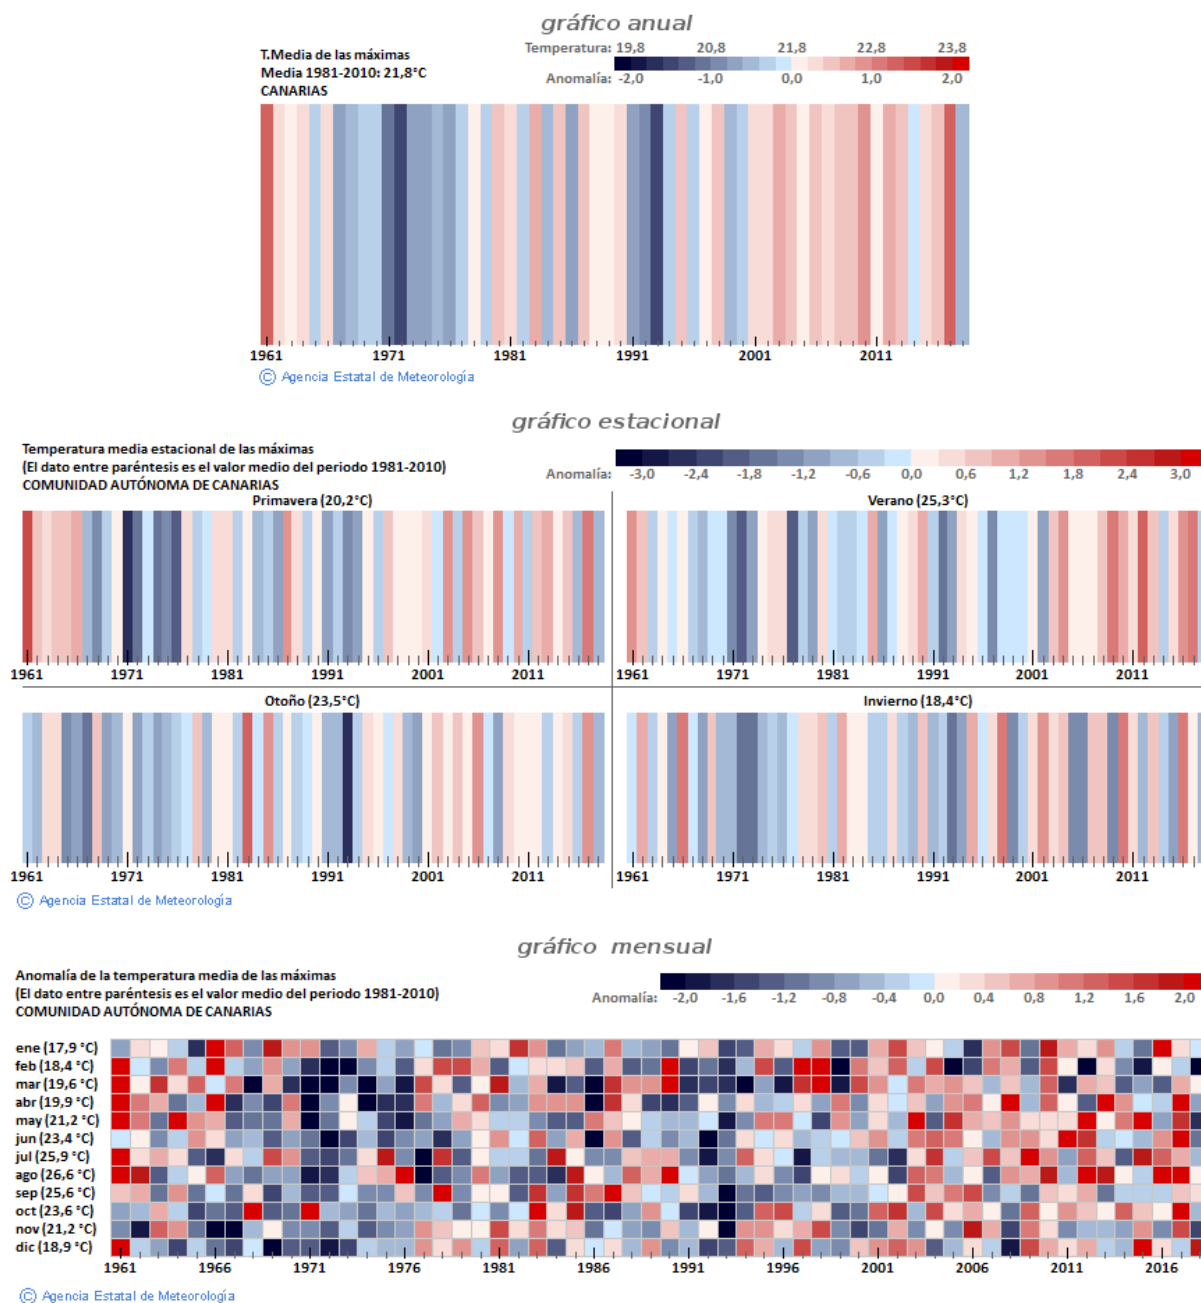

Figura E.14: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Canarias.

## Temperatura media de las mínimas

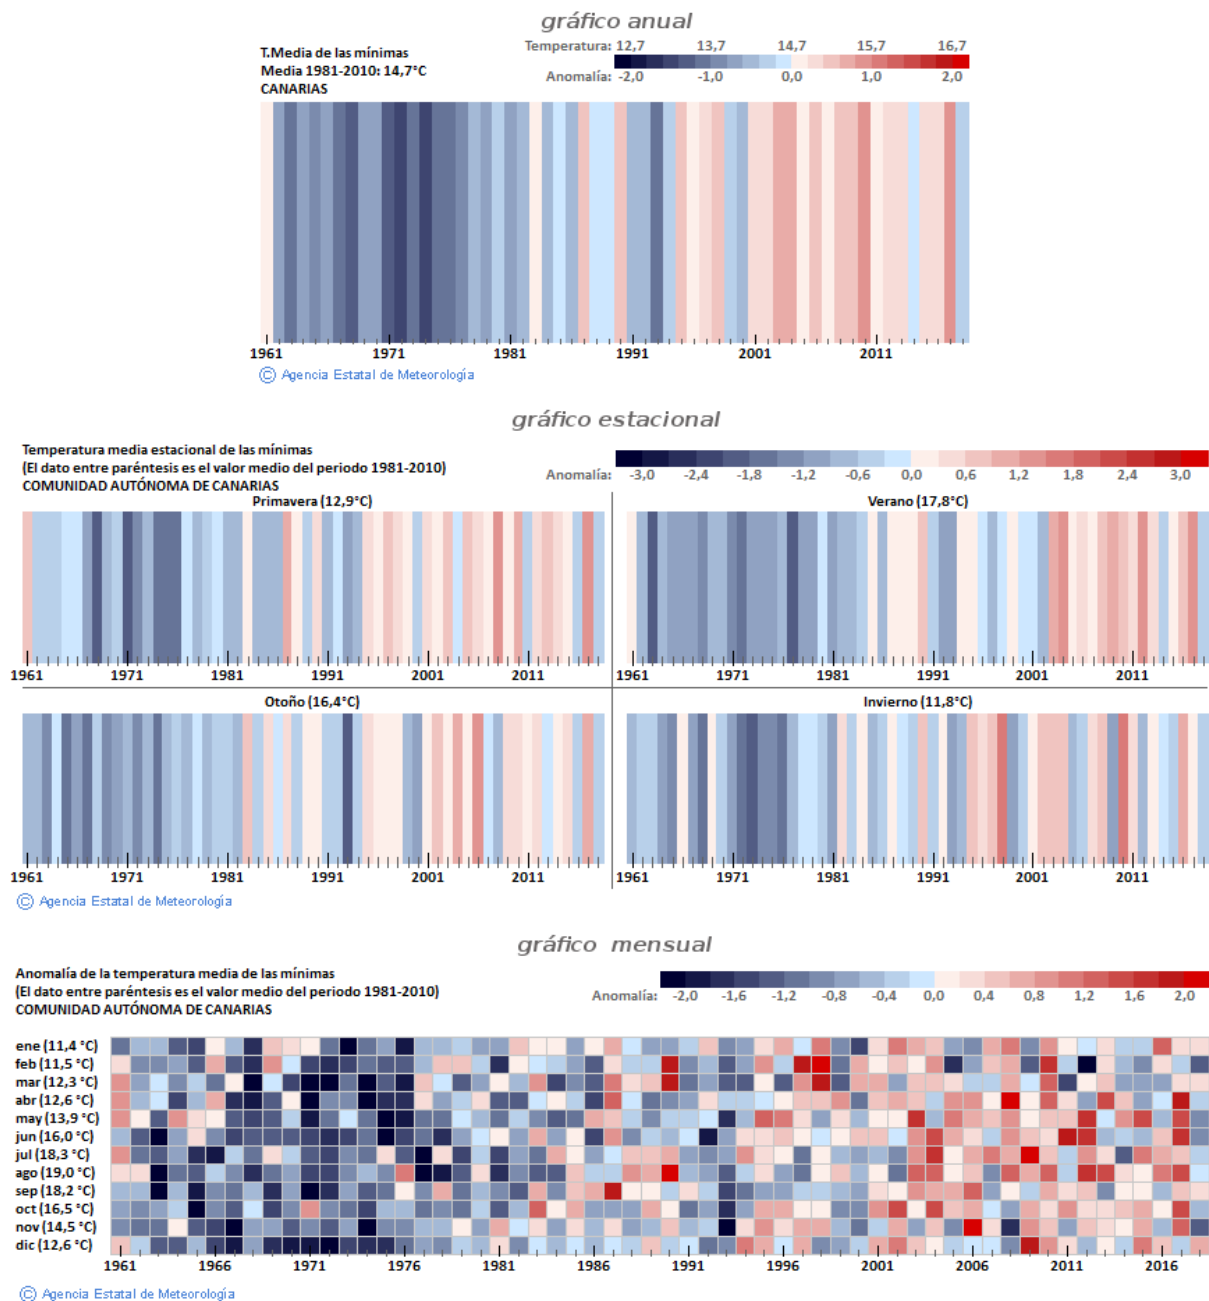

Figura E.15: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Canarias.

## E.6 Cantabria

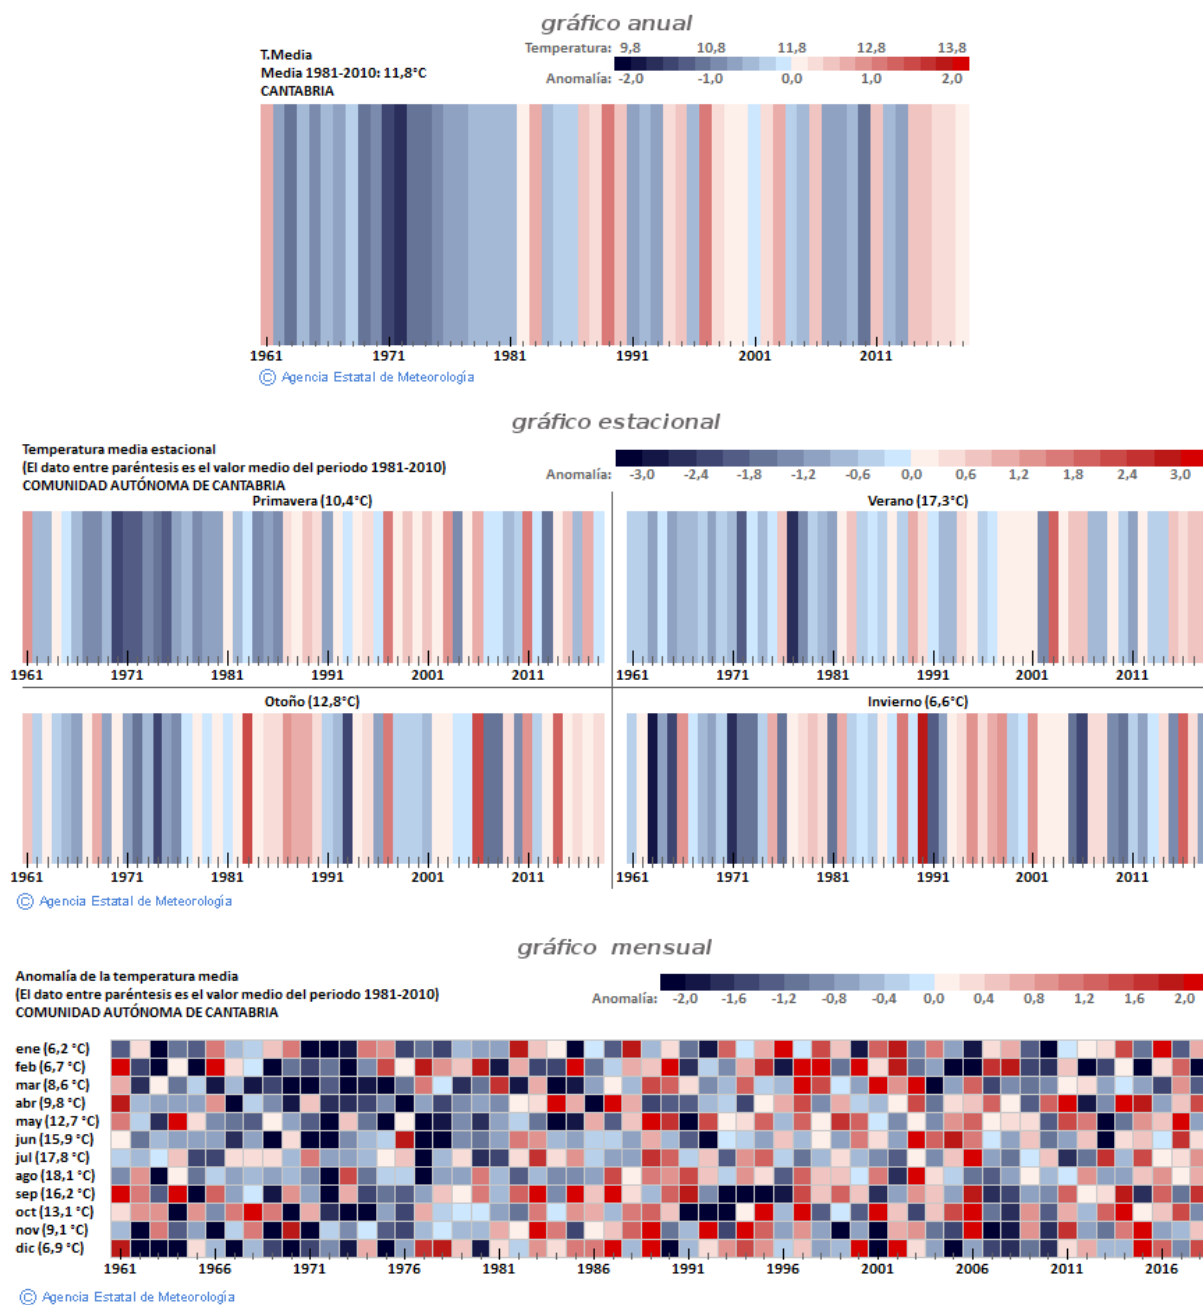

**Temperatura media**

Figura E.16: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Cantabria.

## Temperatura media de las máximas

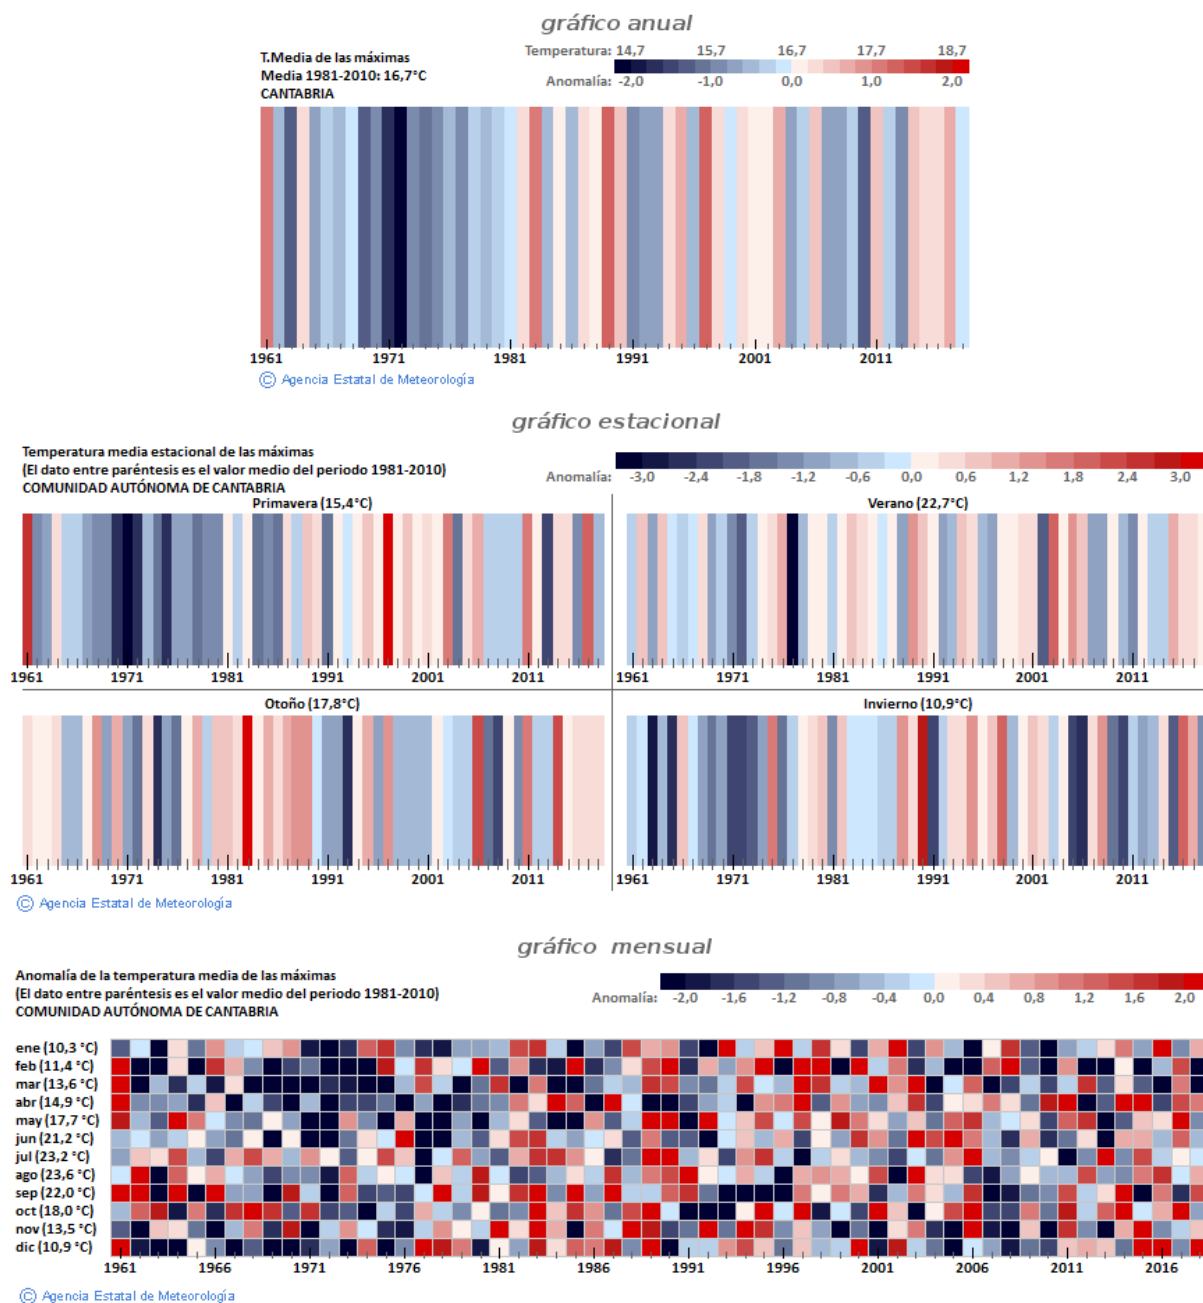

Figura E.17: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Cantabria.

## Temperatura media de las mínimas

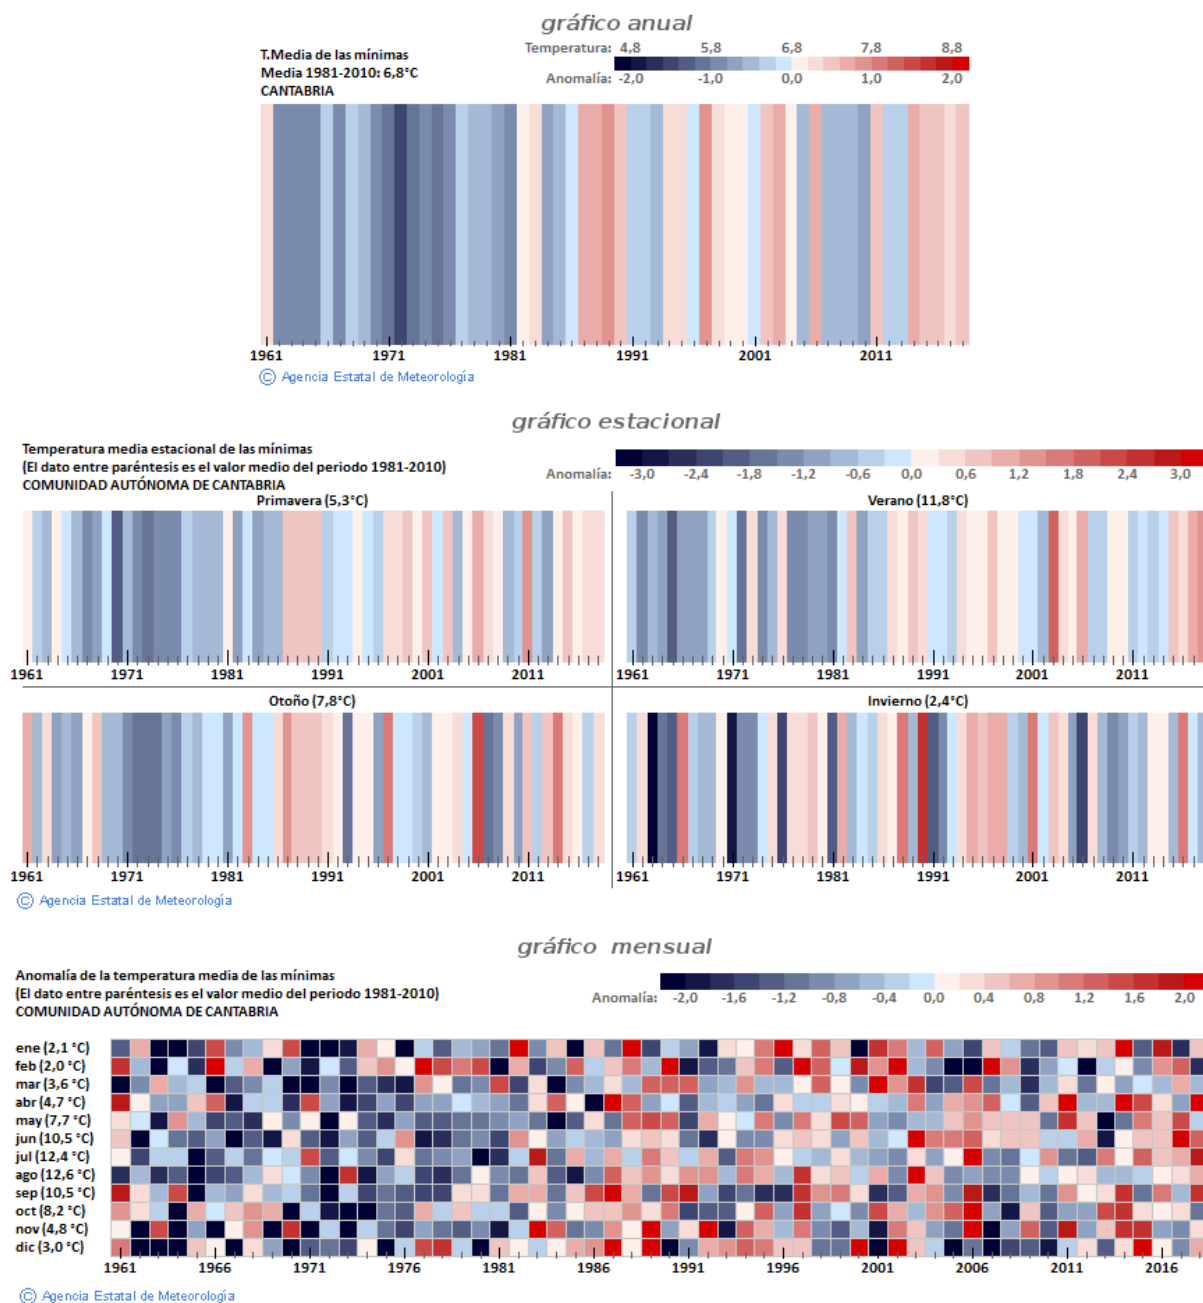

Figura E.18: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Cantabria.

## E.7 Castilla y León

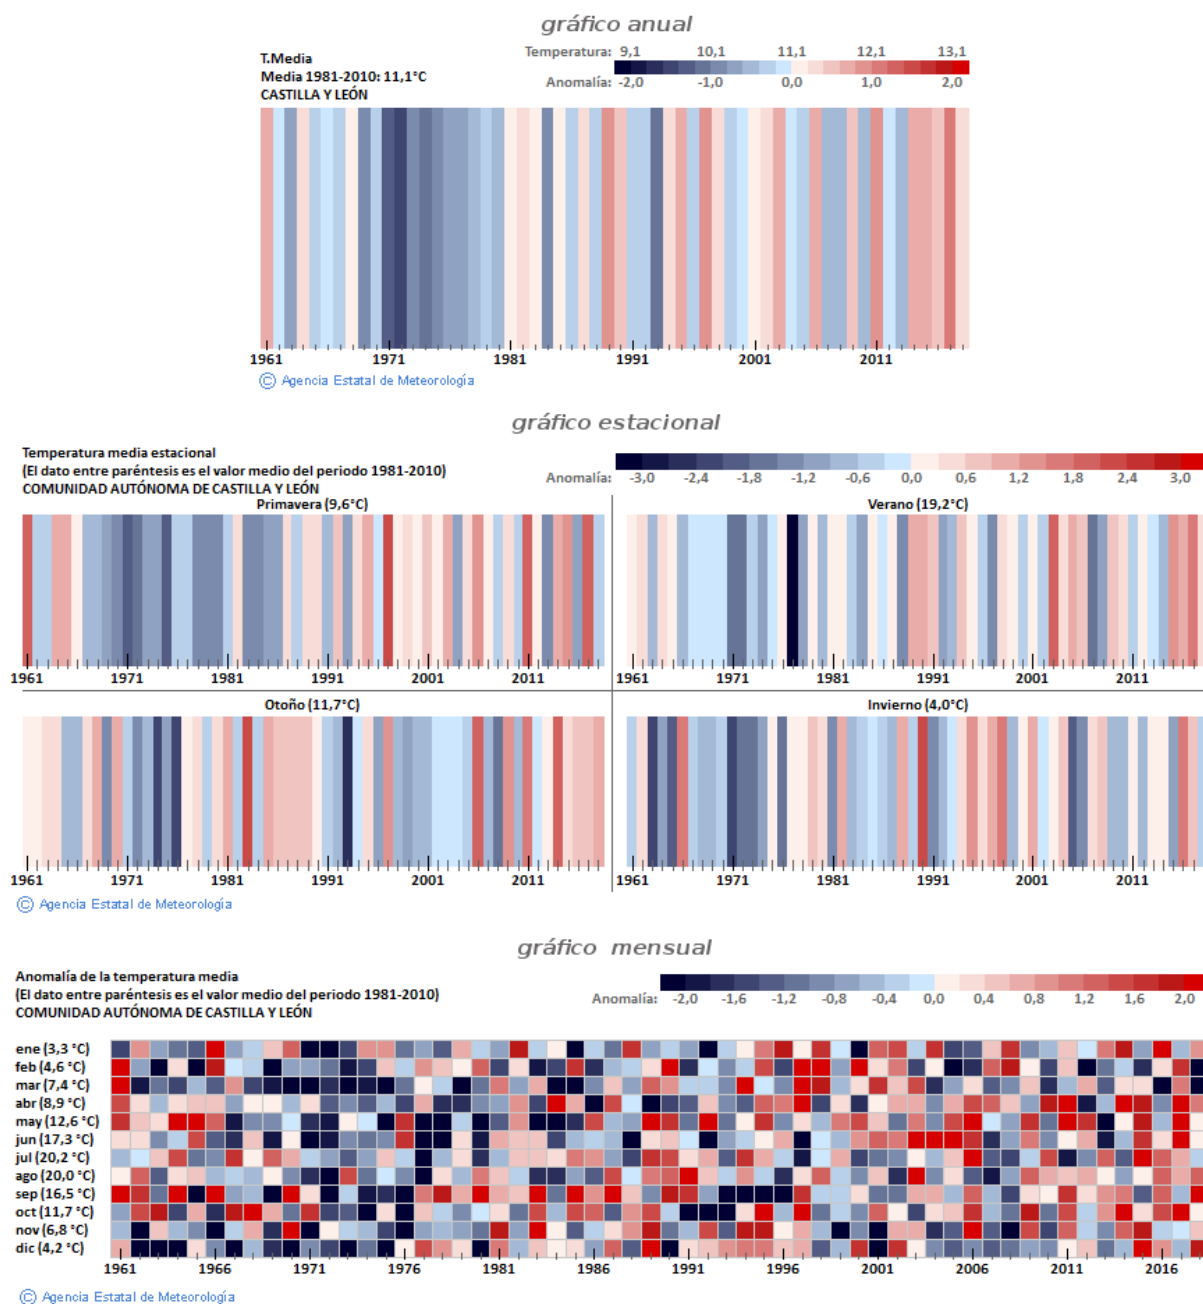

**Temperatura media**

Figura E.19: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Castilla y León.

## Temperatura media de las máximas

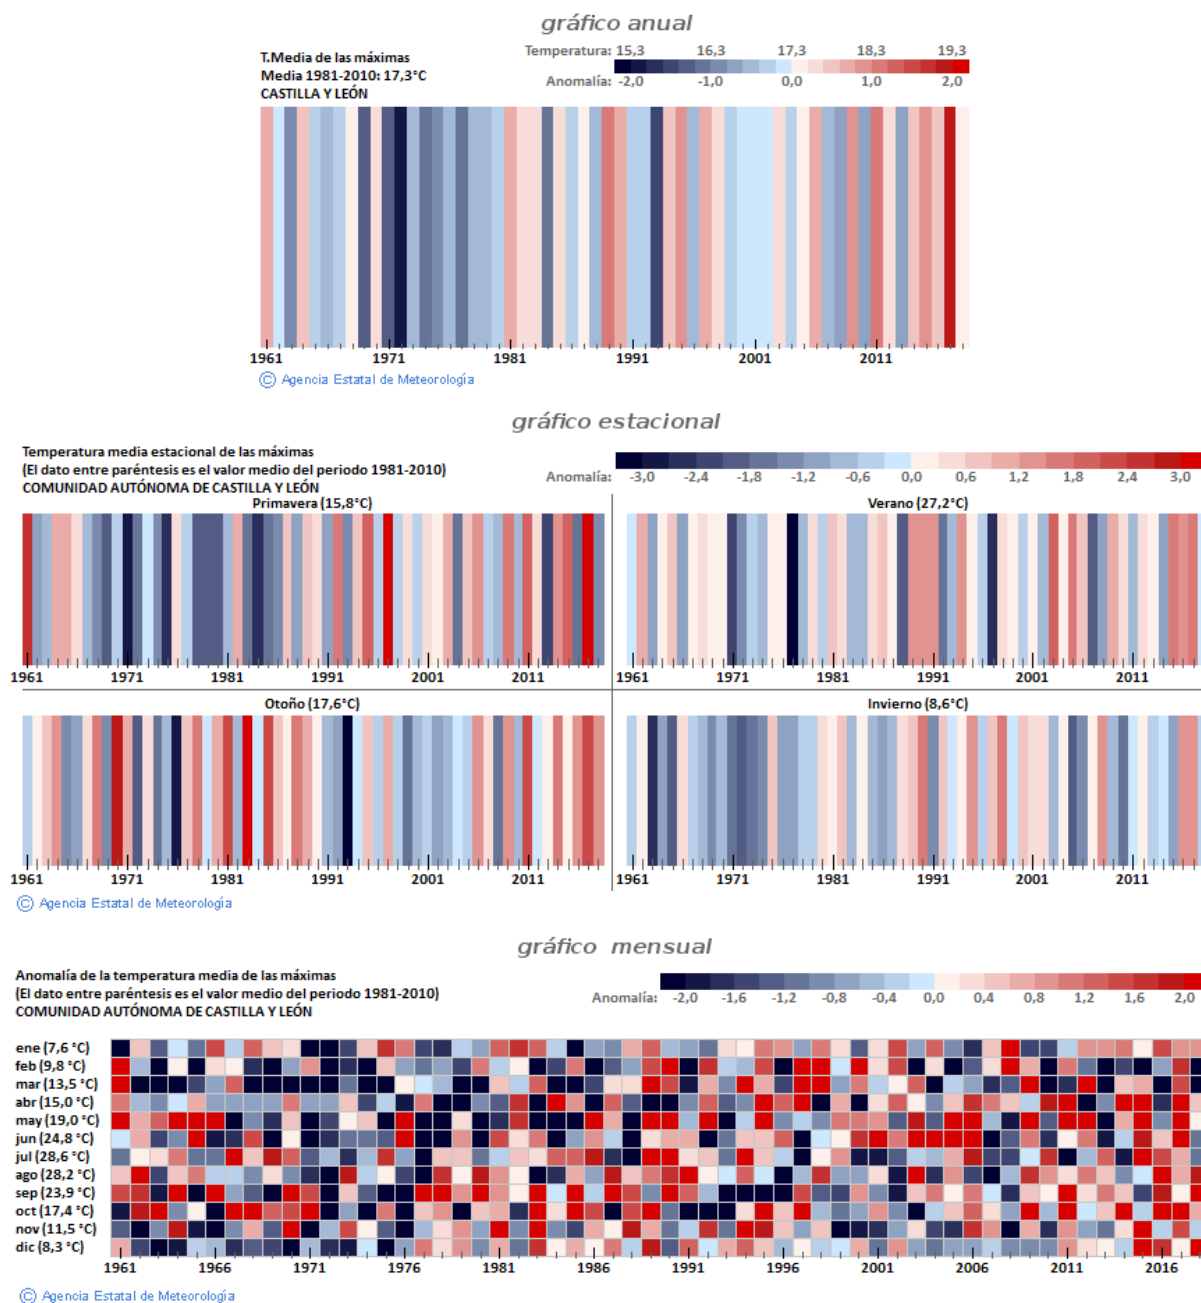

Figura E.20: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Castilla y León.

## Temperatura media de las mínimas

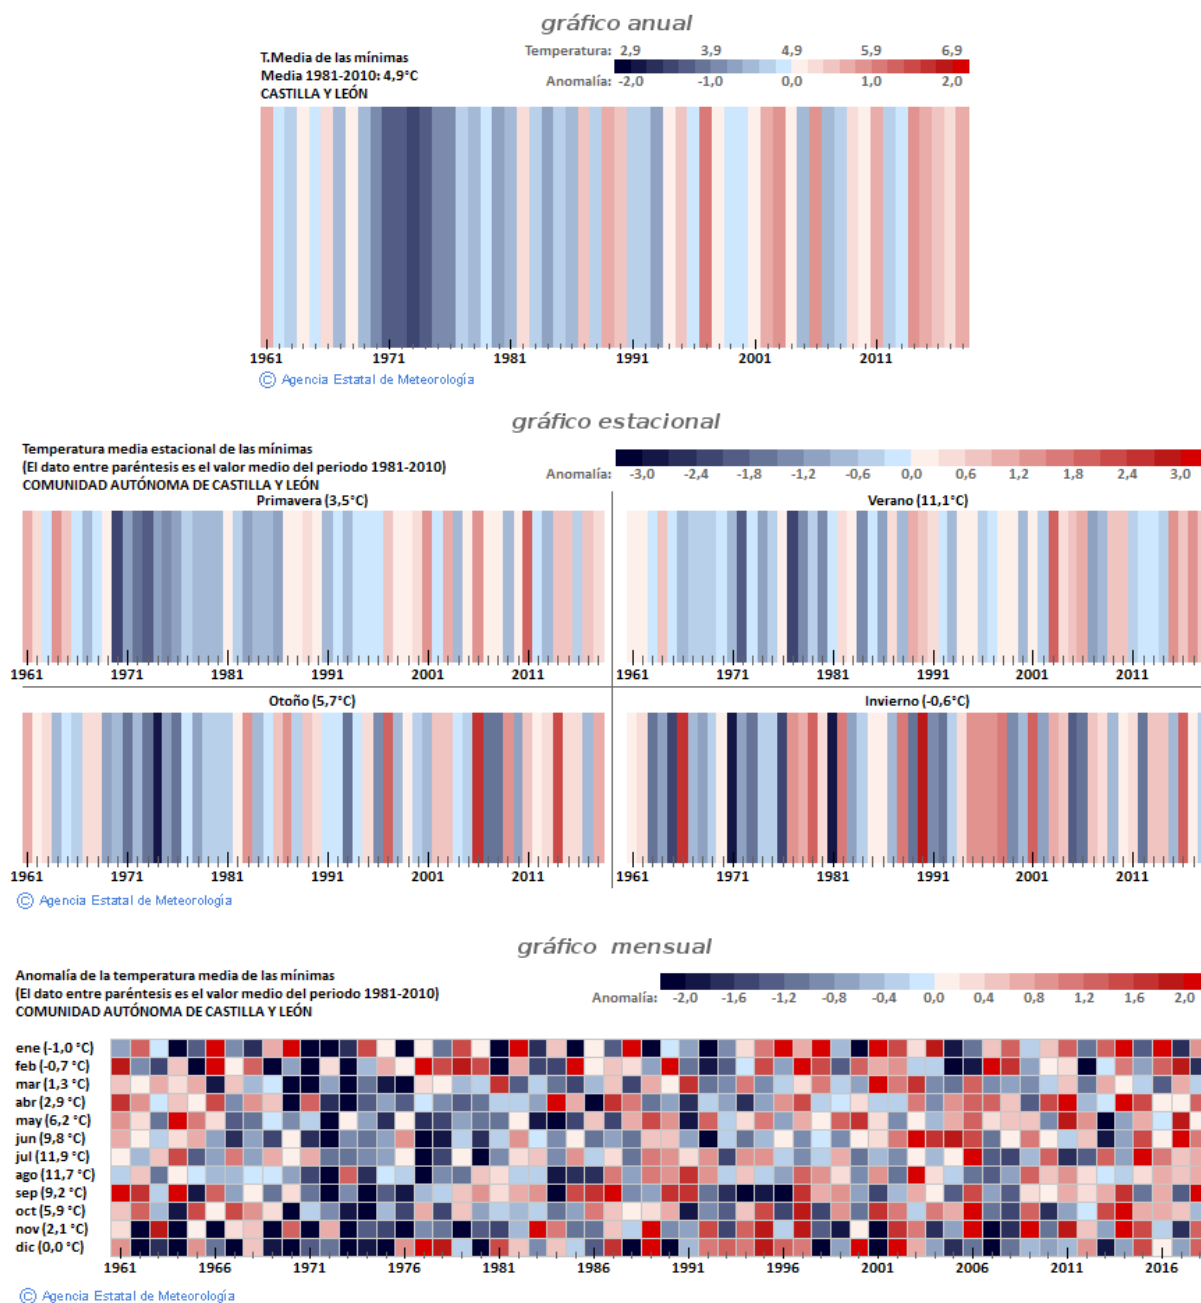

Figura E.21: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Castilla y León.

## E.8 Castilla-La Mancha

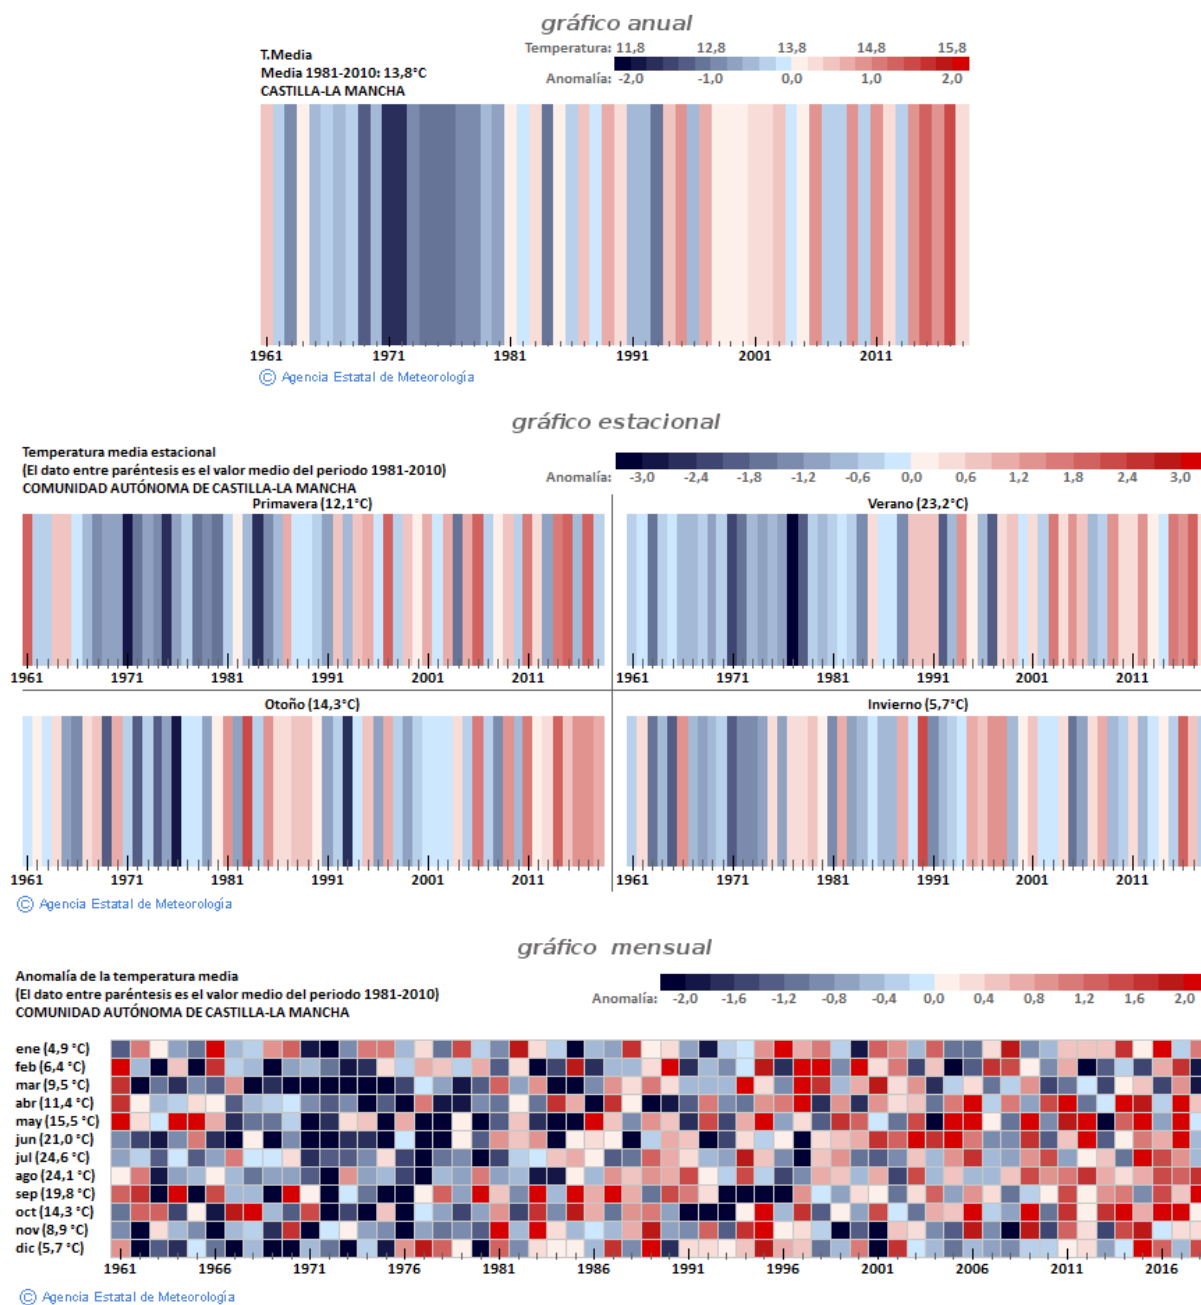

**Temperatura media**

Figura E.22: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Castilla-La Mancha.

## Temperatura media de las máximas

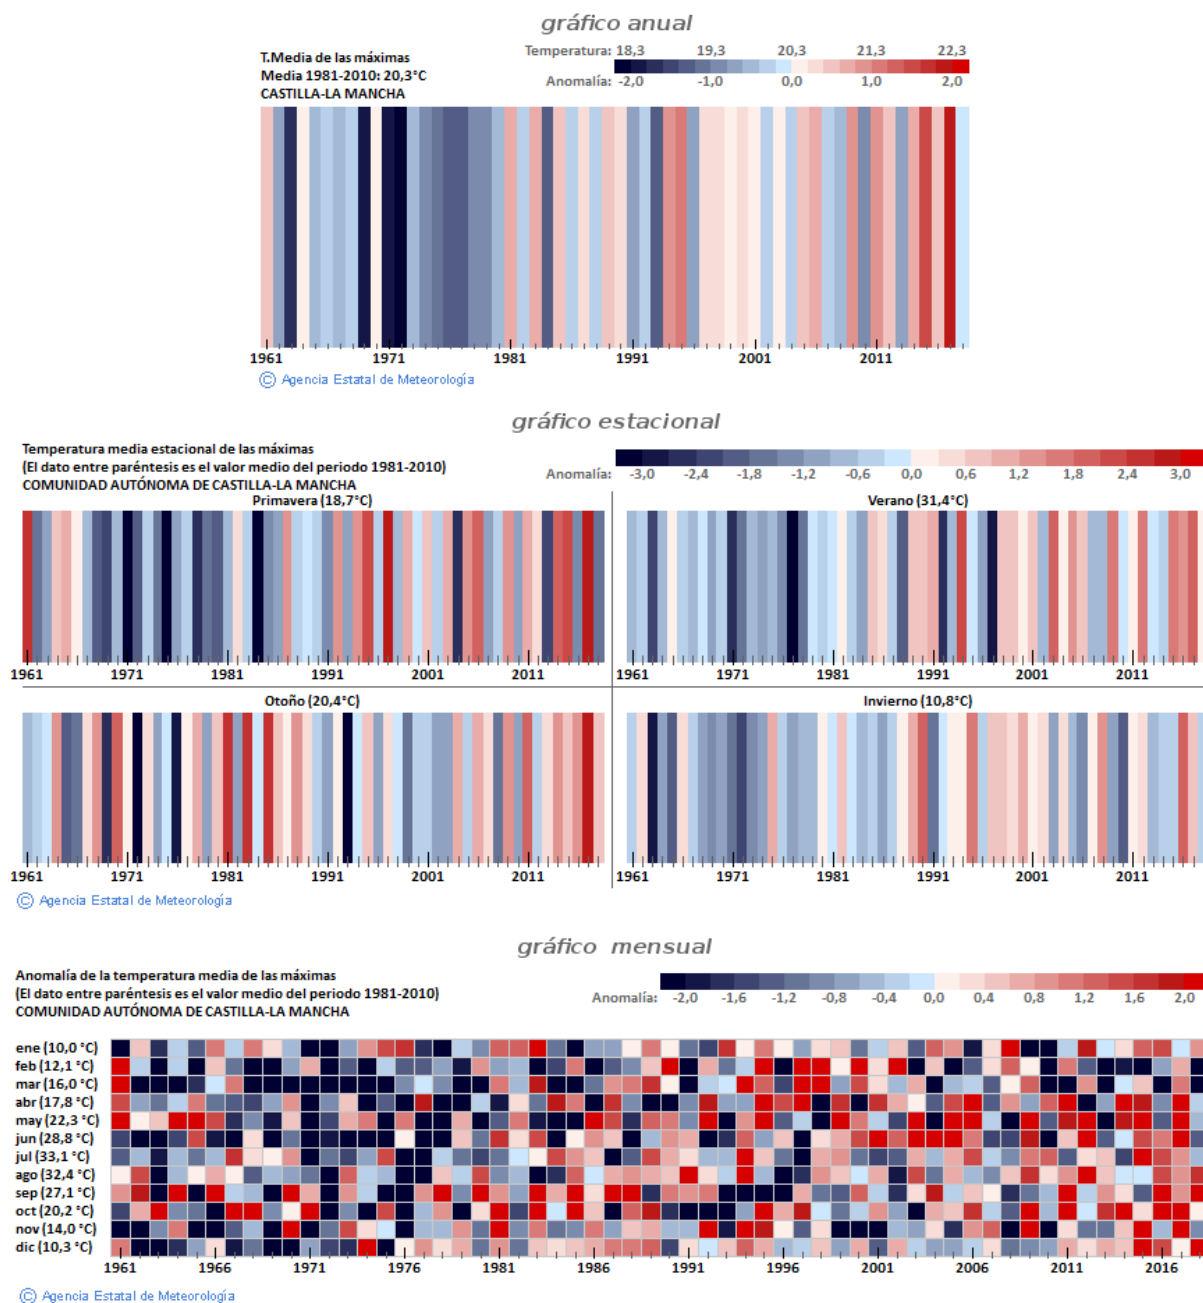

Figura E.23: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Castilla-La Mancha.

## Temperatura media de las mínimas

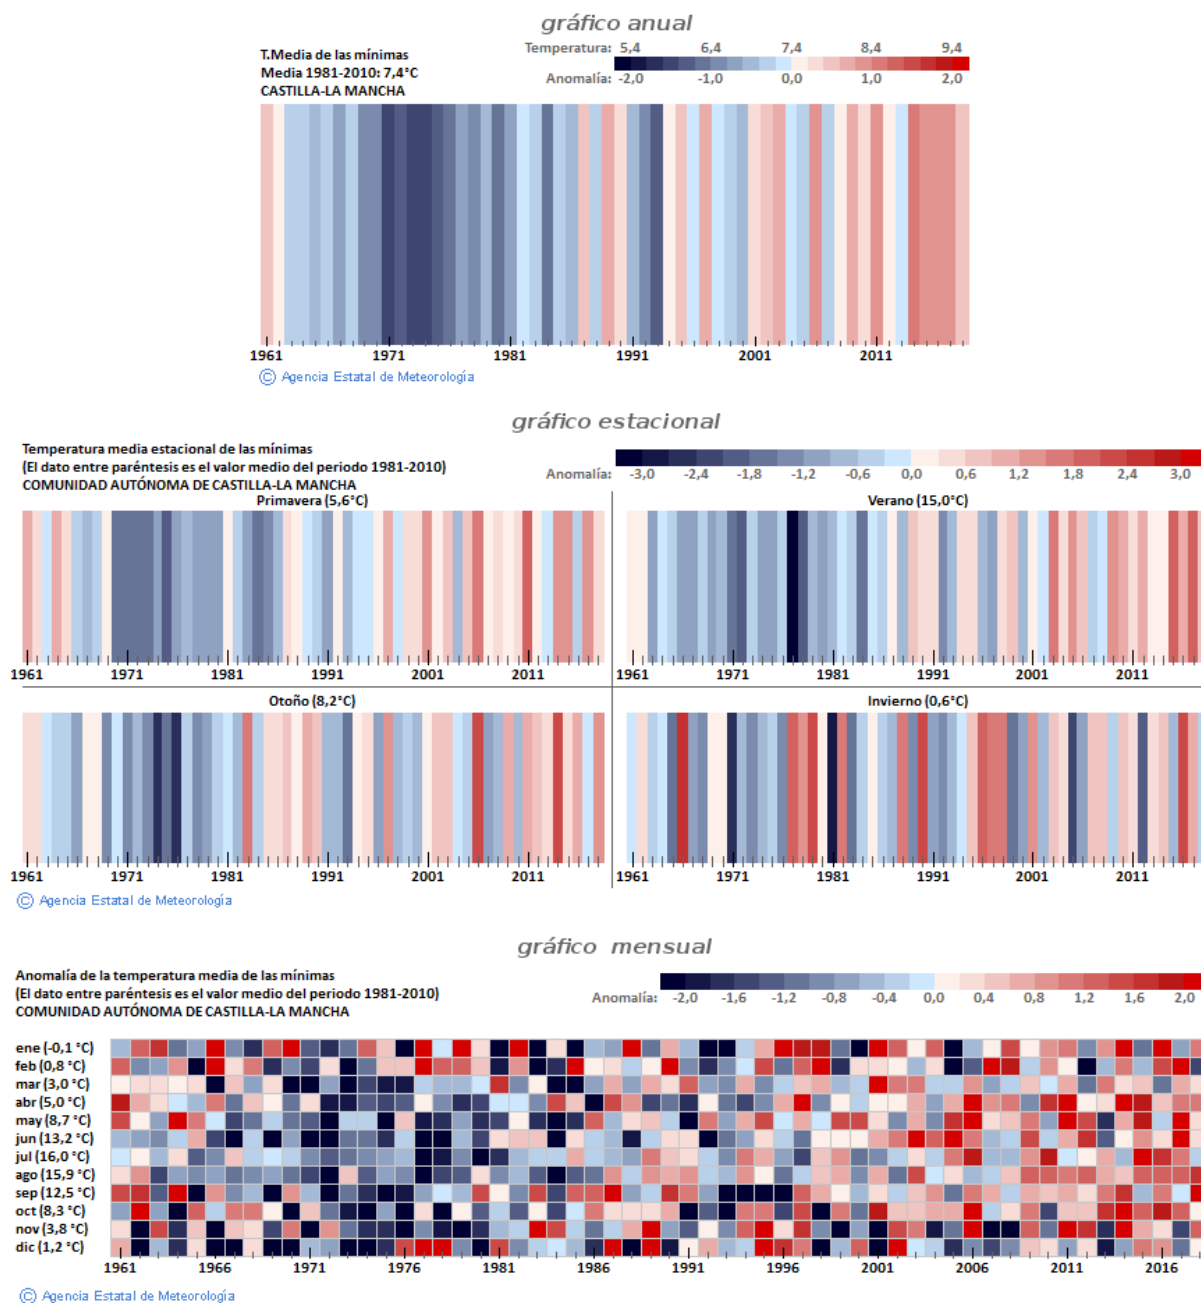

Figura E.24: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Castilla-La Mancha.

## E.9 Cataluña

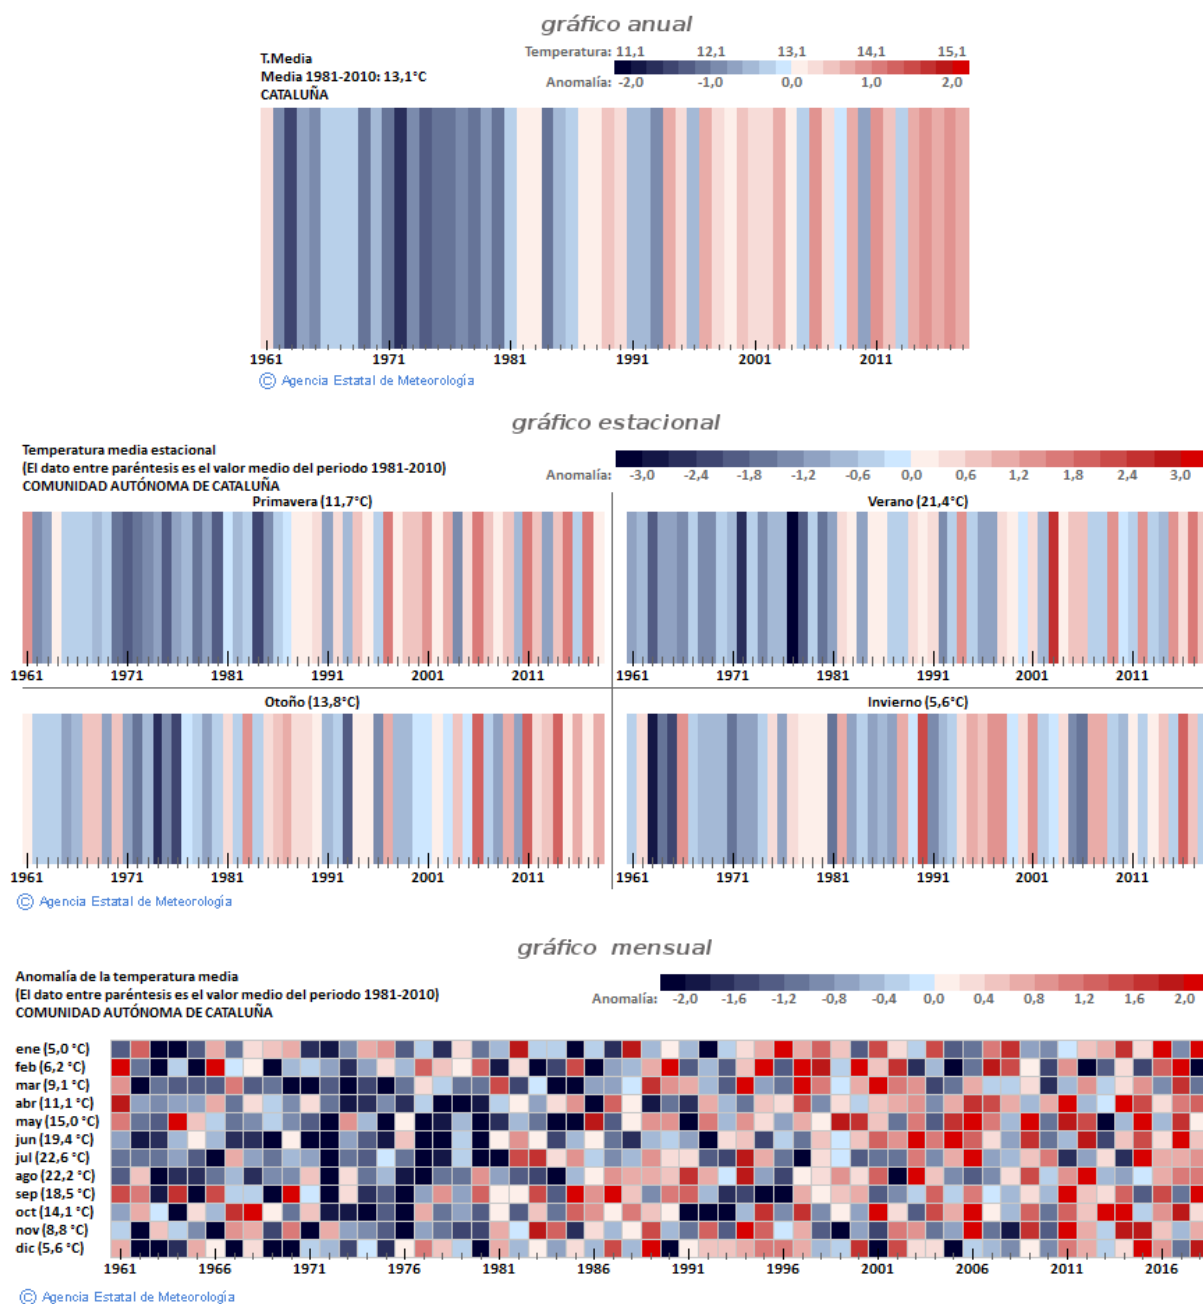

Figura E.25: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Cataluña.

## Temperatura media de las máximas

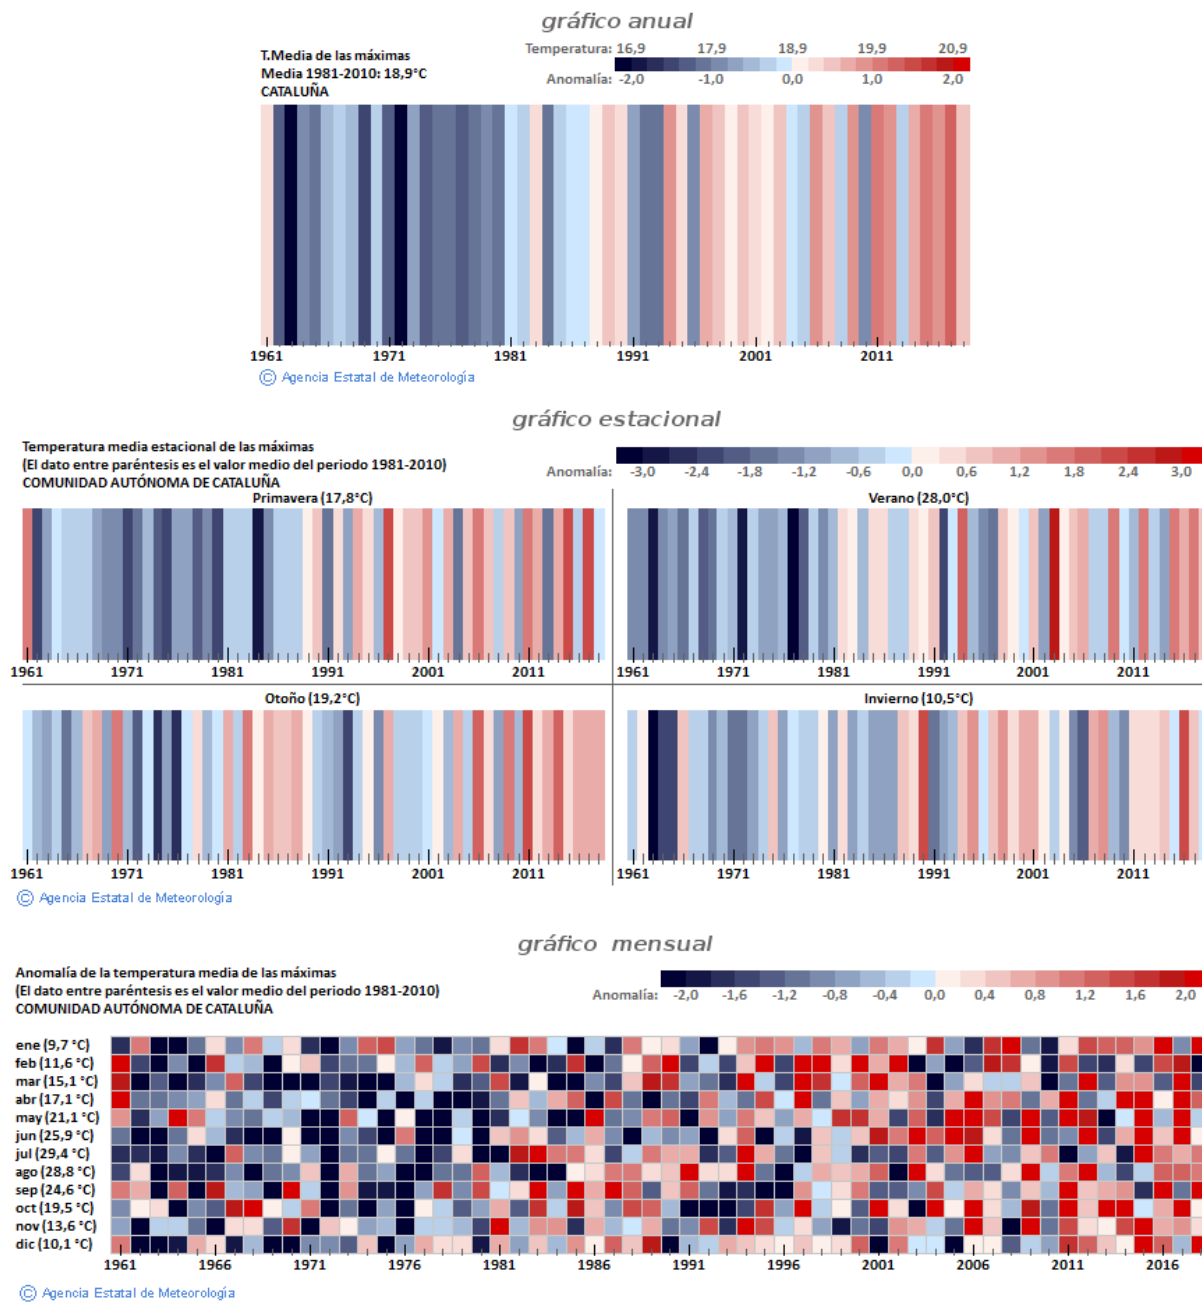

Figura E.26: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Cataluña.

## Temperatura media de las mínimas

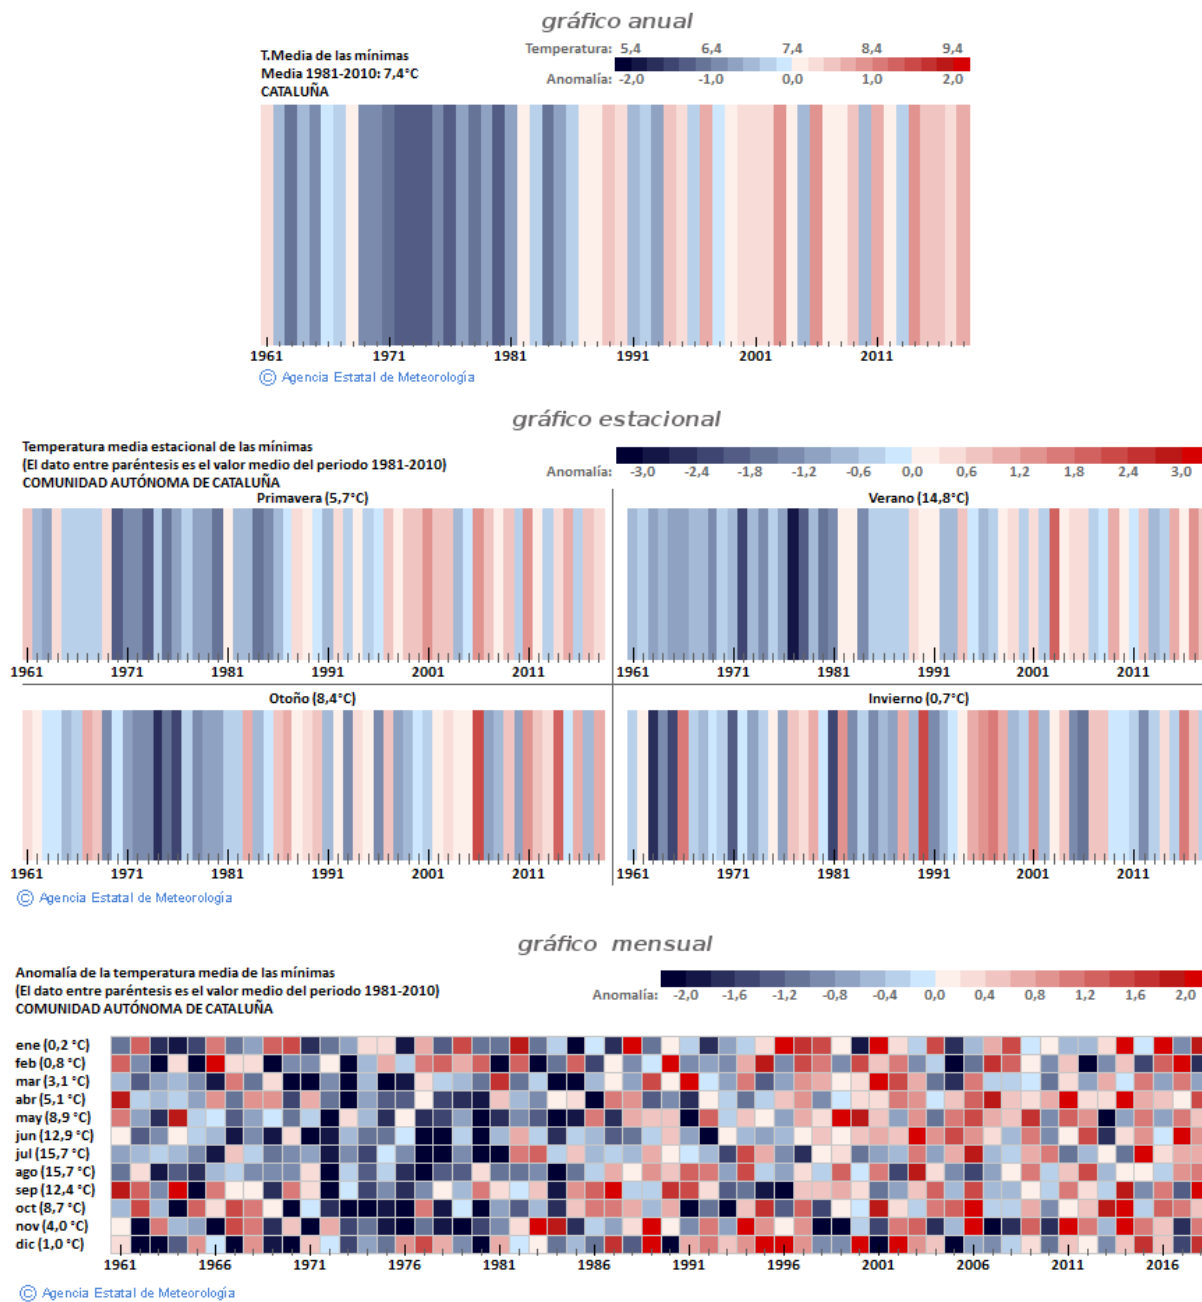

Figura E.27: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Cataluña.

## E.10 Comunitat Valenciana

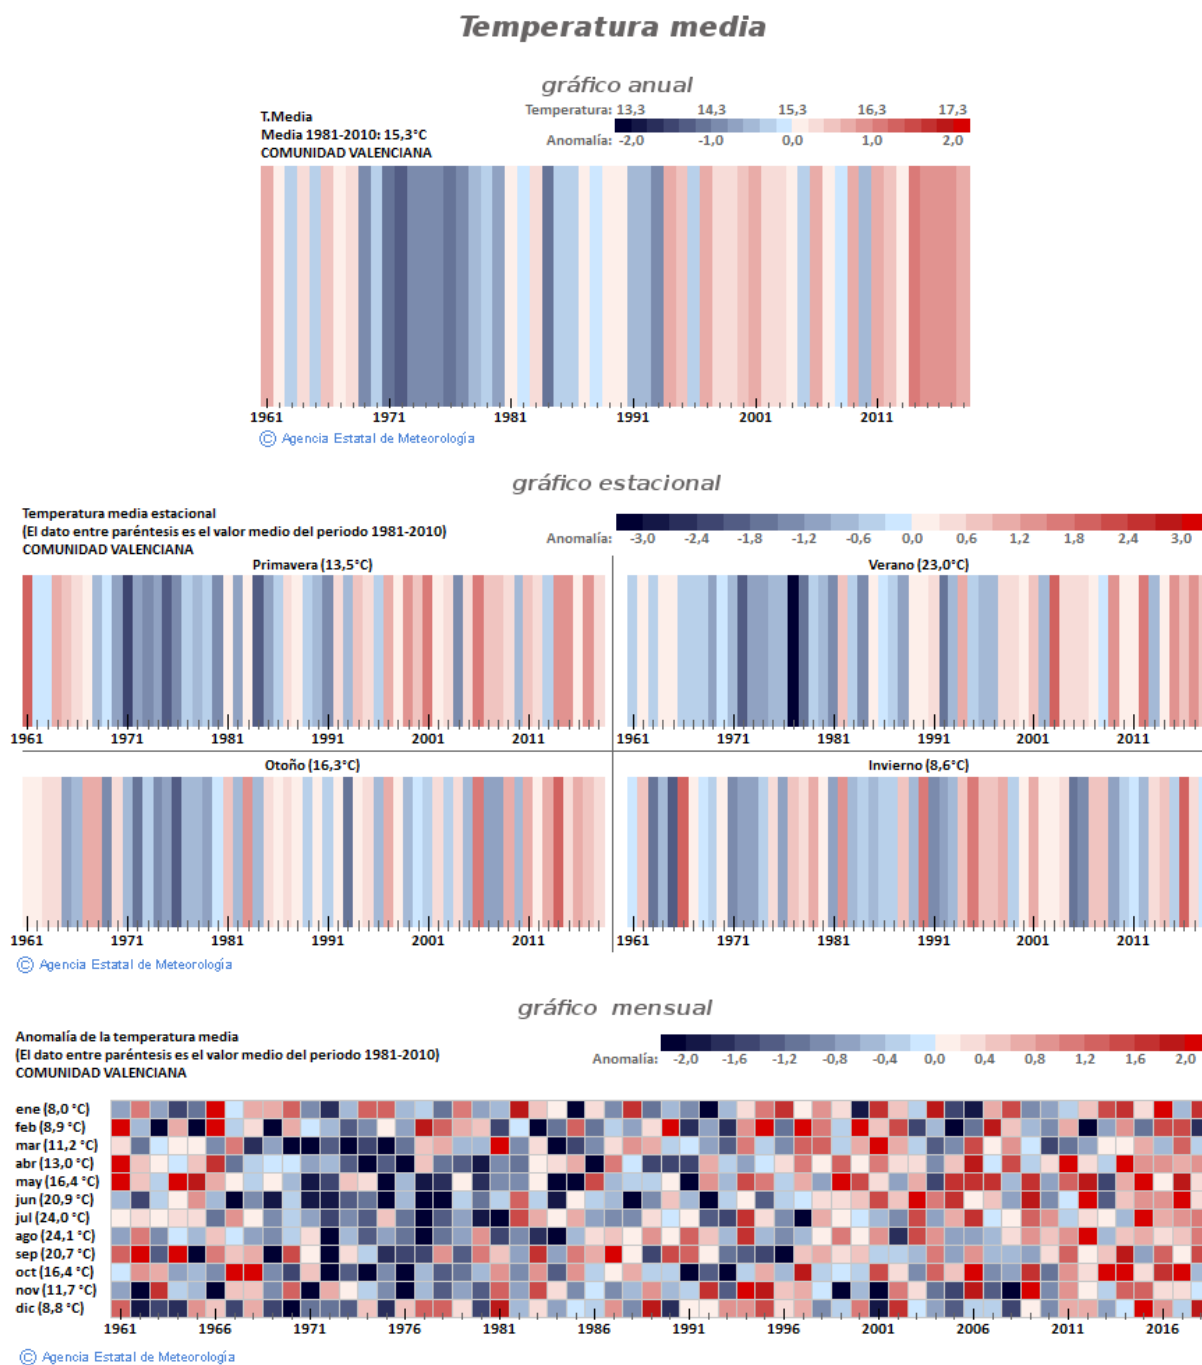

Figura E.28: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la Comunitat Valenciana.

## Temperatura media de las máximas

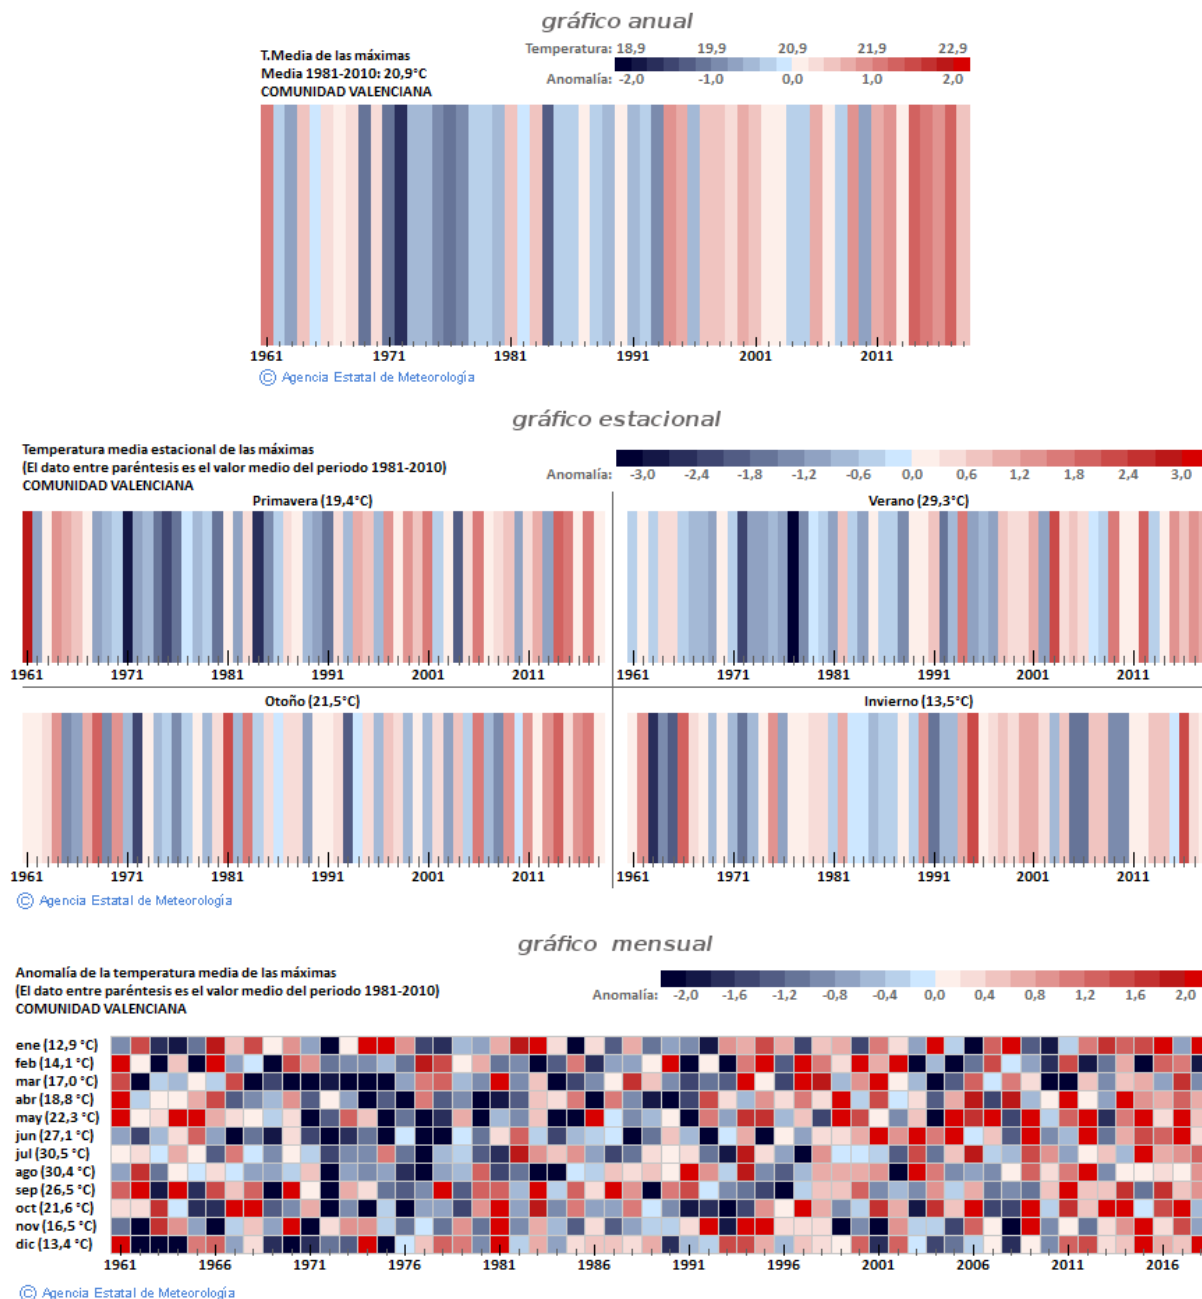

Figura E.29: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la Comunitat Valenciana.

## Temperatura media de las mínimas

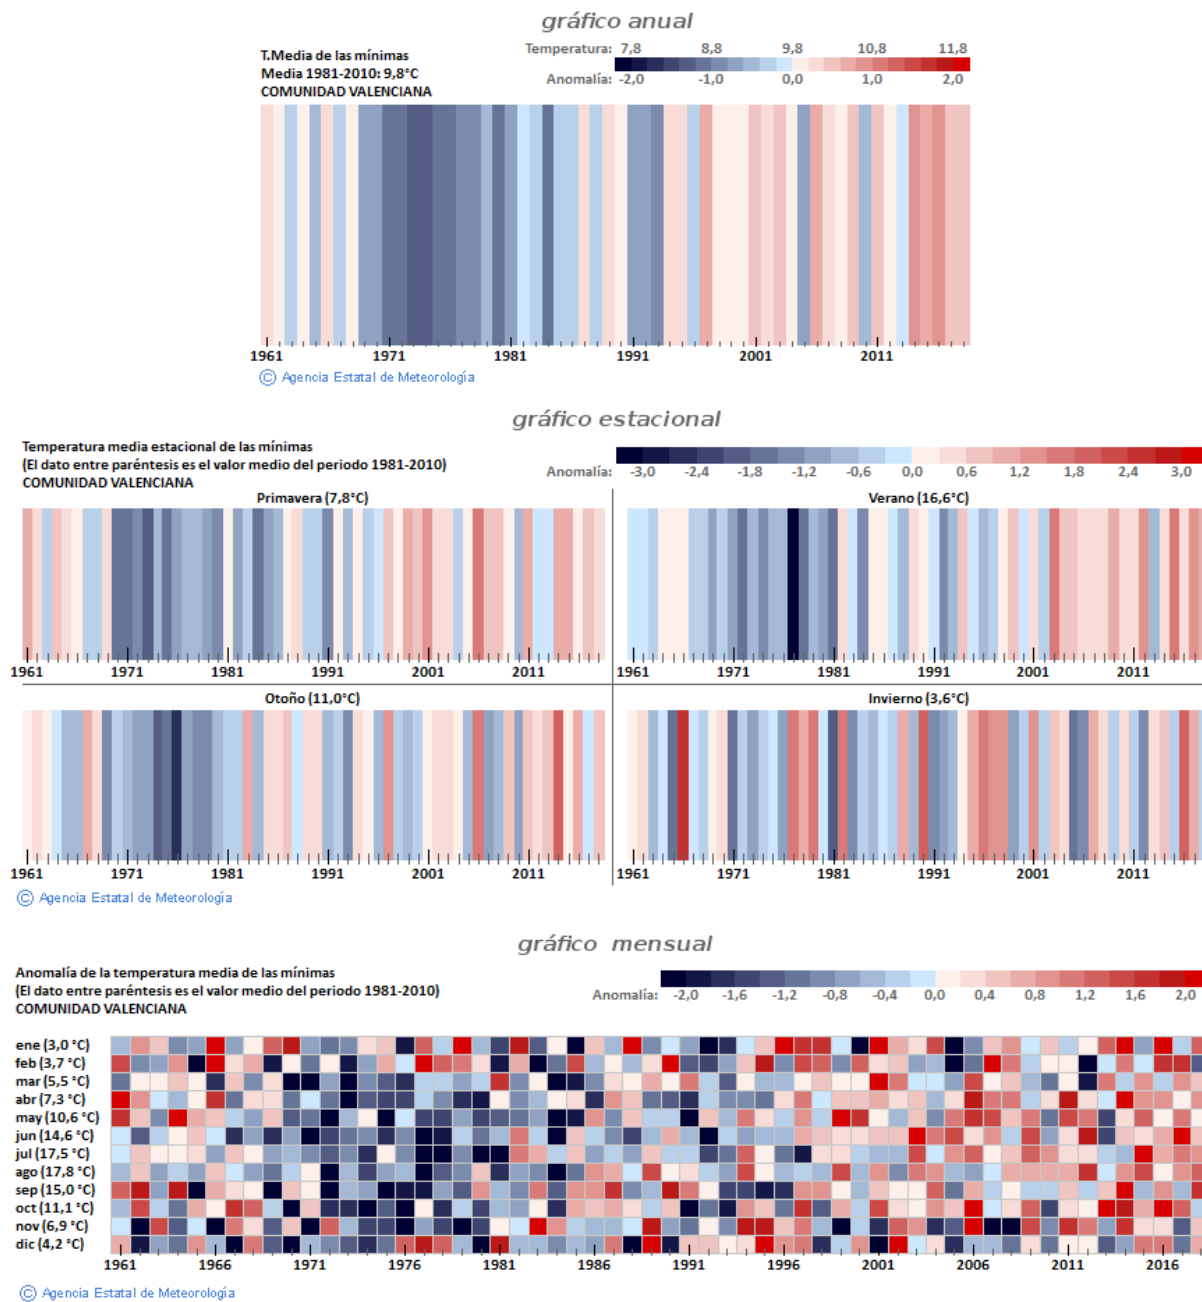

Figura E.30: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la Comunitat Valenciana.

## E.11 Extremadura

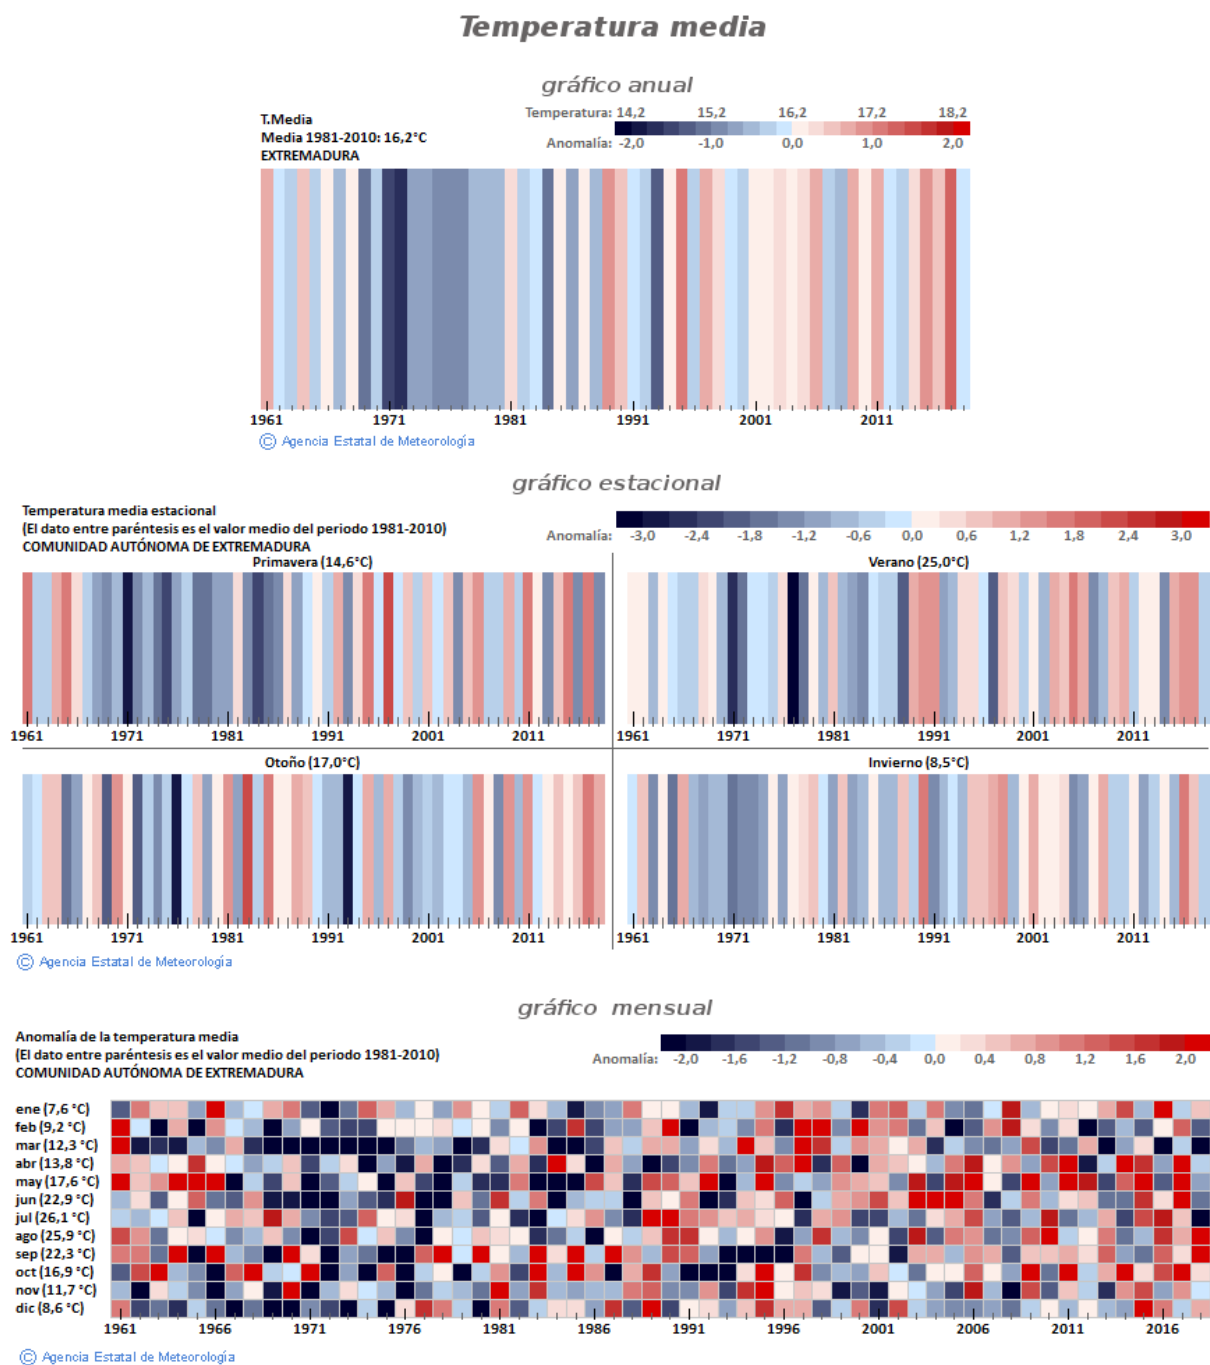

Figura E.31: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Extremadura.

## Temperatura media de las máximas

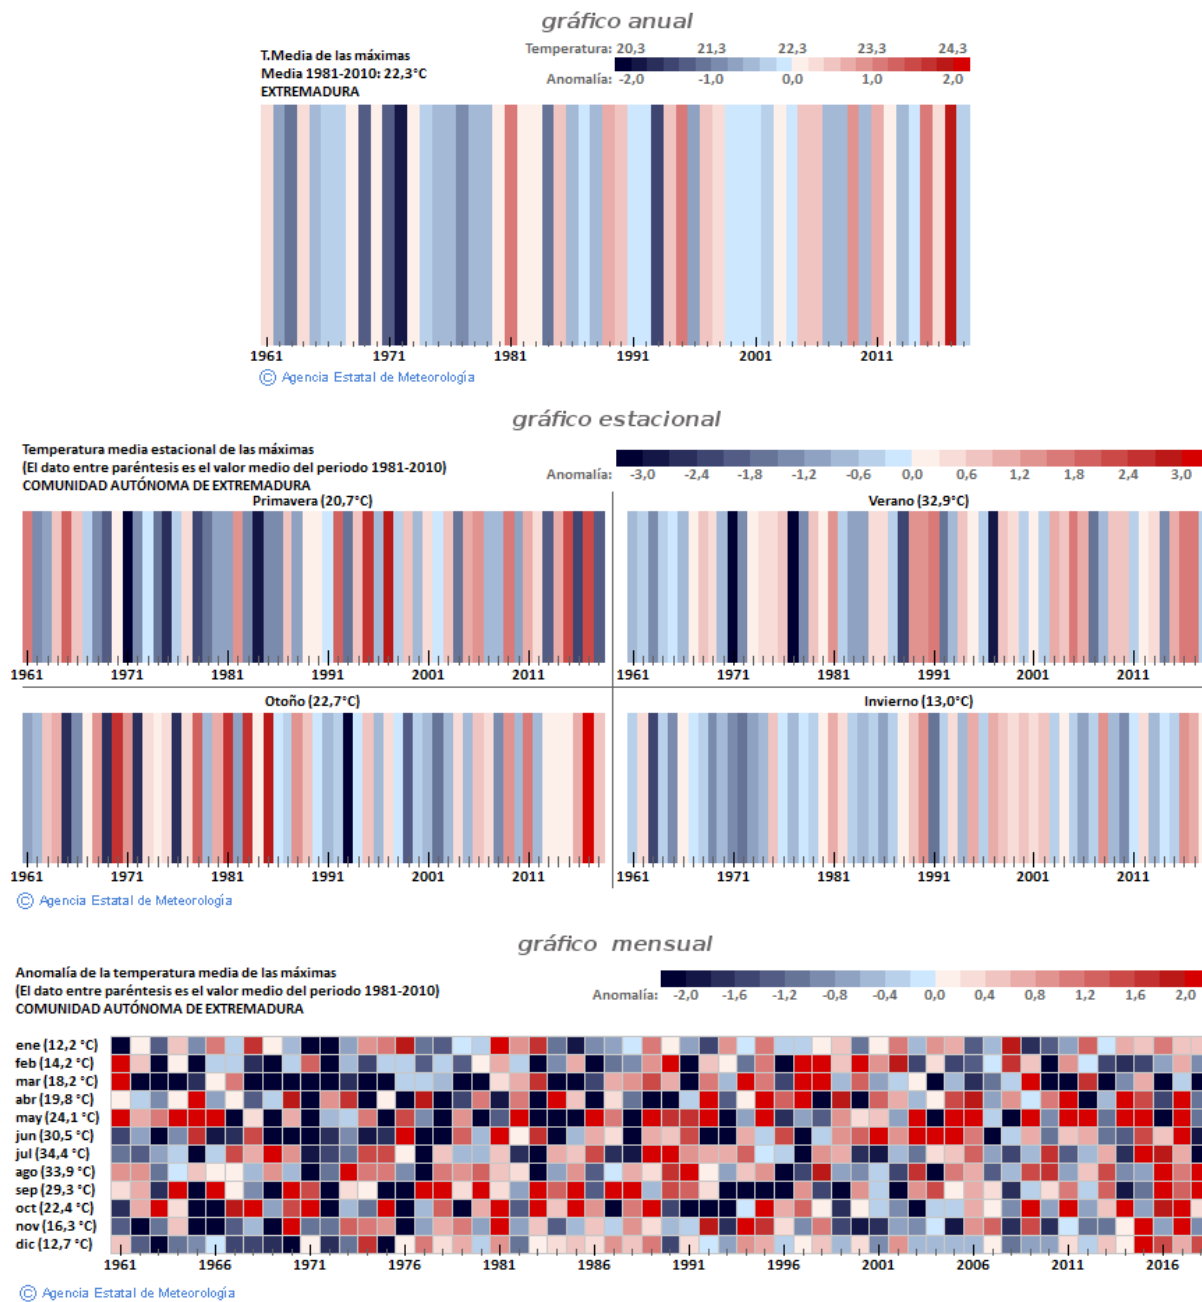

Figura E.32: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Extremadura.

## Temperatura media de las mínimas

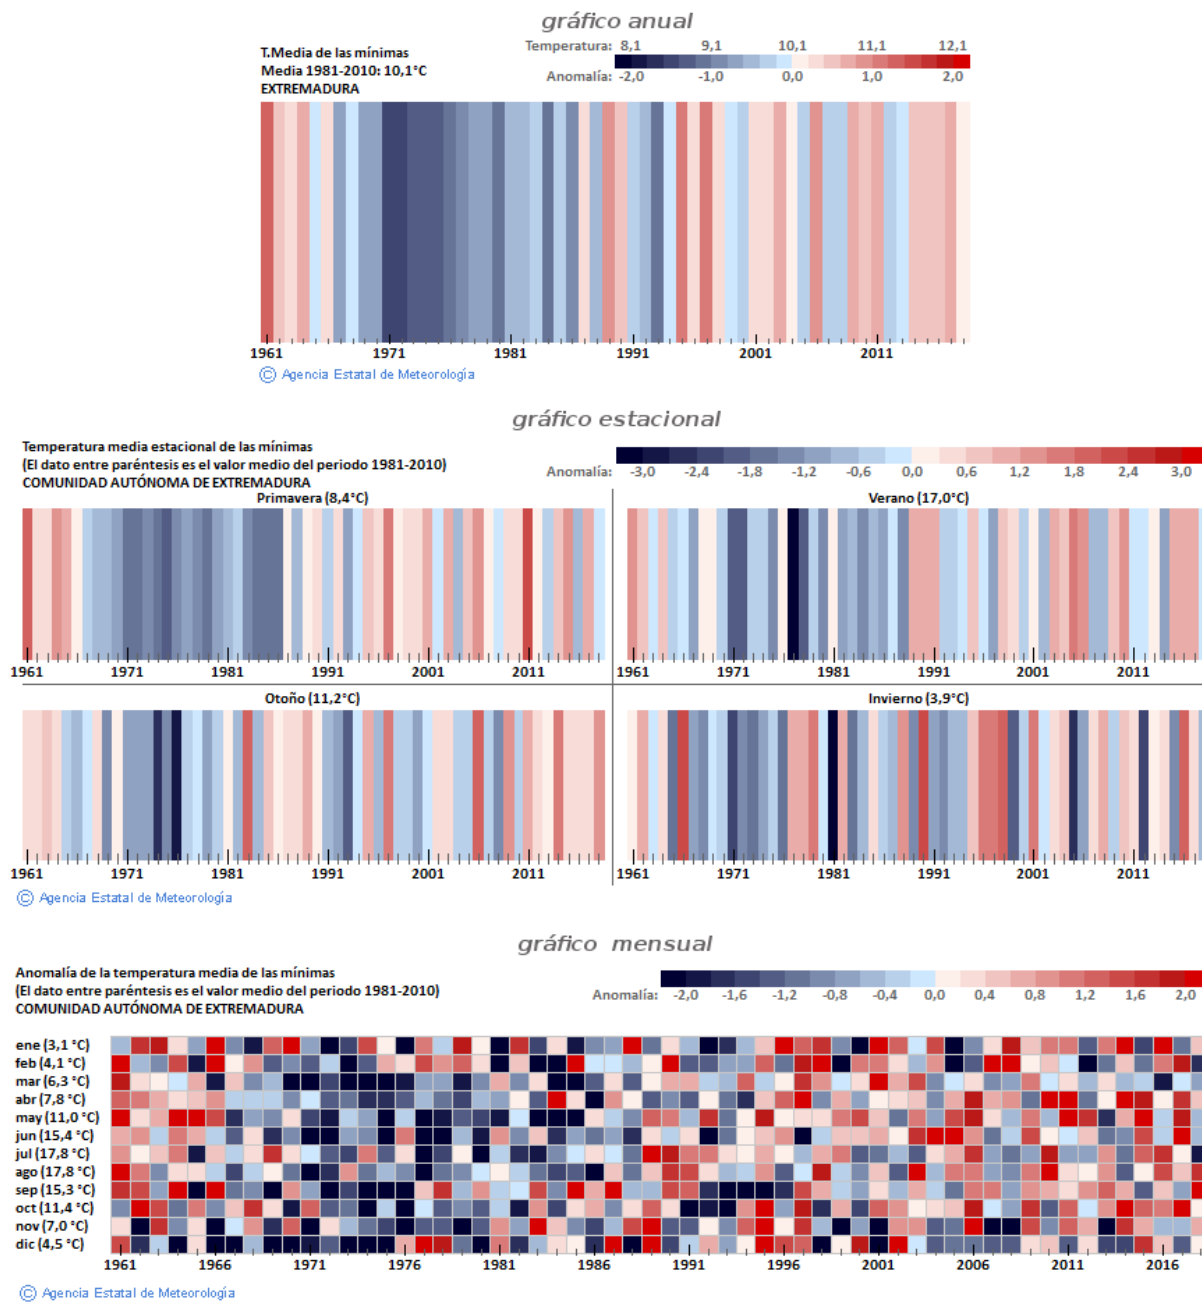

Figura E.33: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Extremadura.

## E.12 Galicia

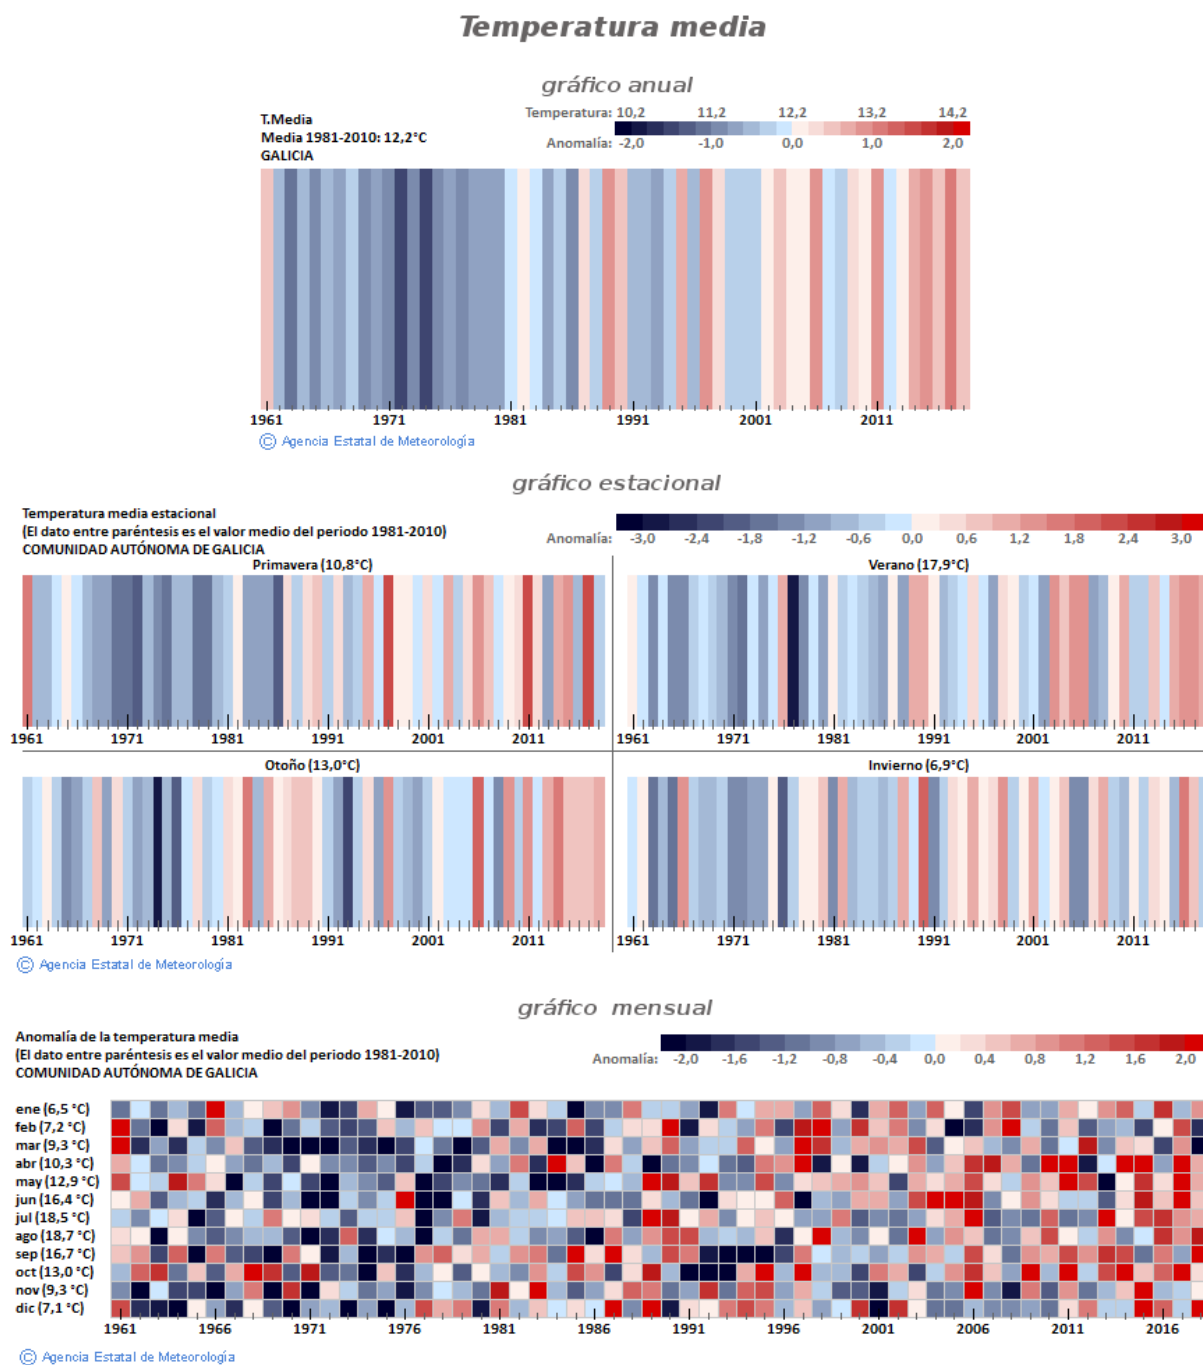

Figura E.34: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Galicia.

## Temperatura media de las máximas

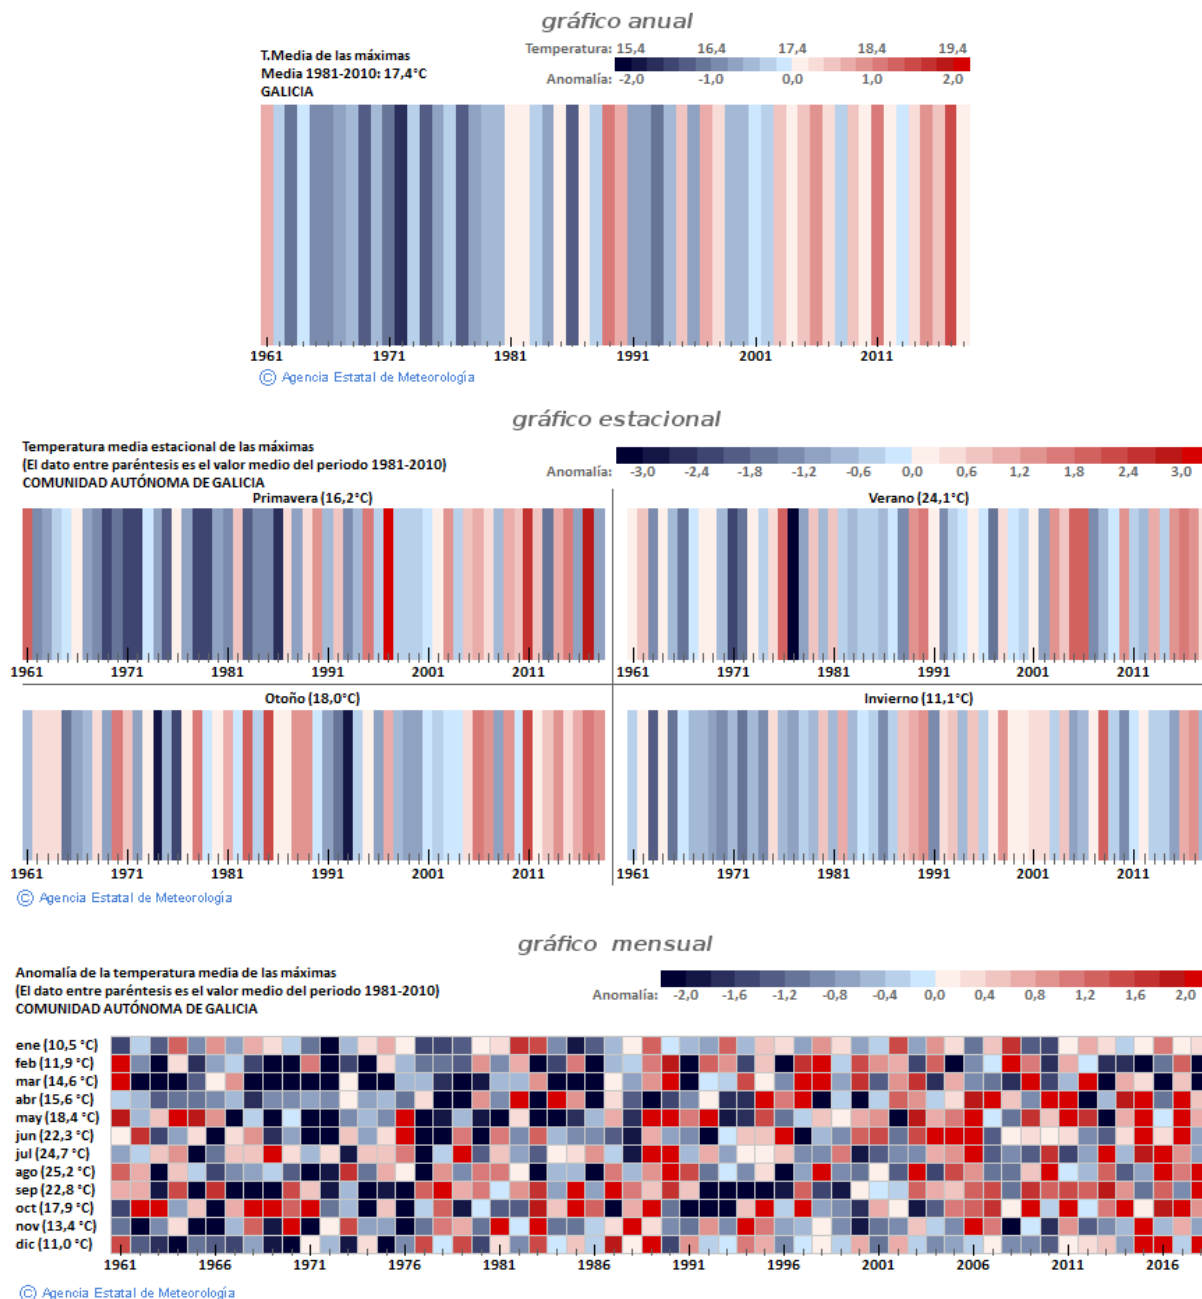

Figura E.35: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Galicia.

## Temperatura media de las mínimas

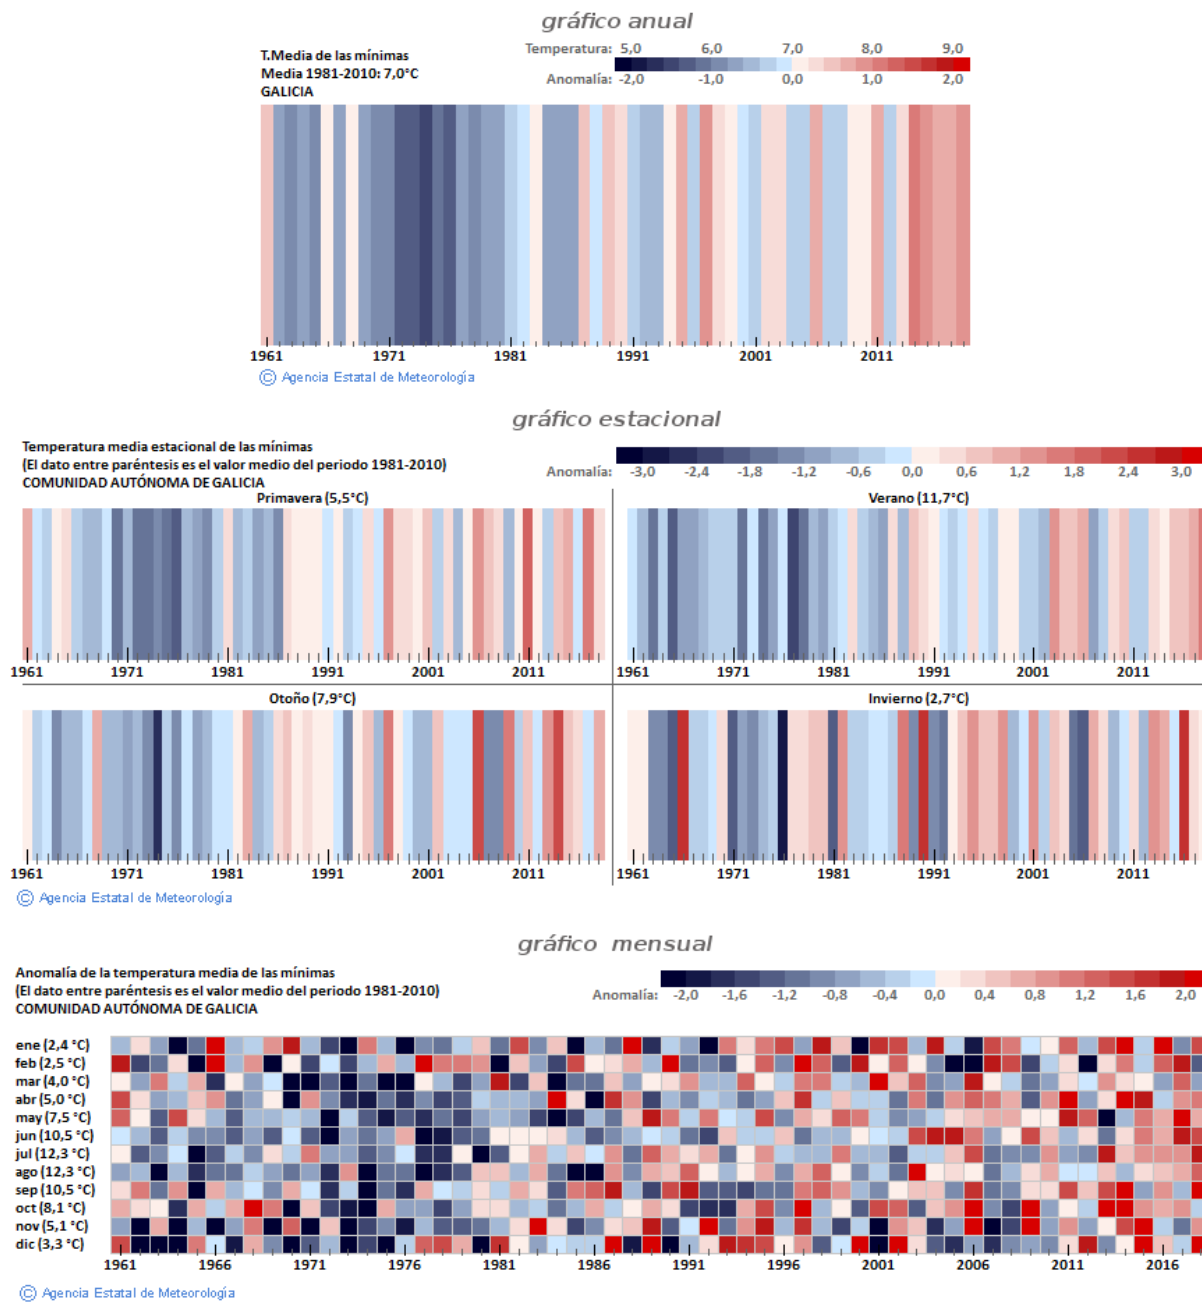

Figura E.36: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de Galicia.

## E.13 Comunidad de Madrid

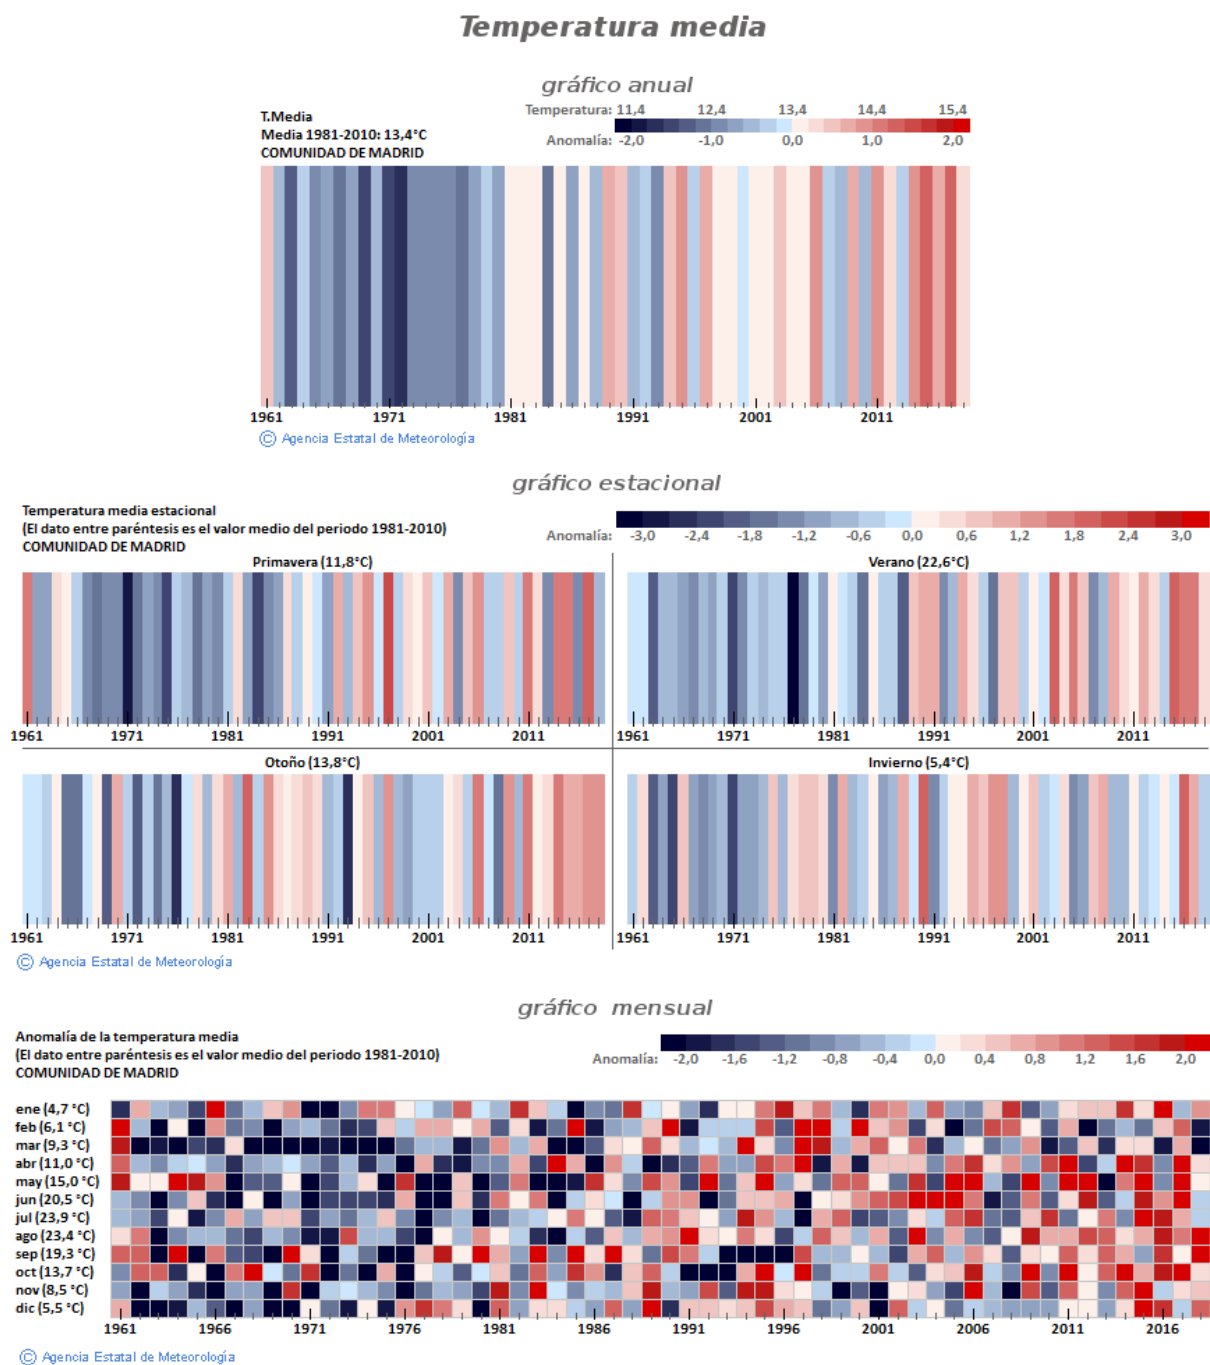

Figura E.37: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la Comunidad de Madrid.

## Temperatura media de las máximas

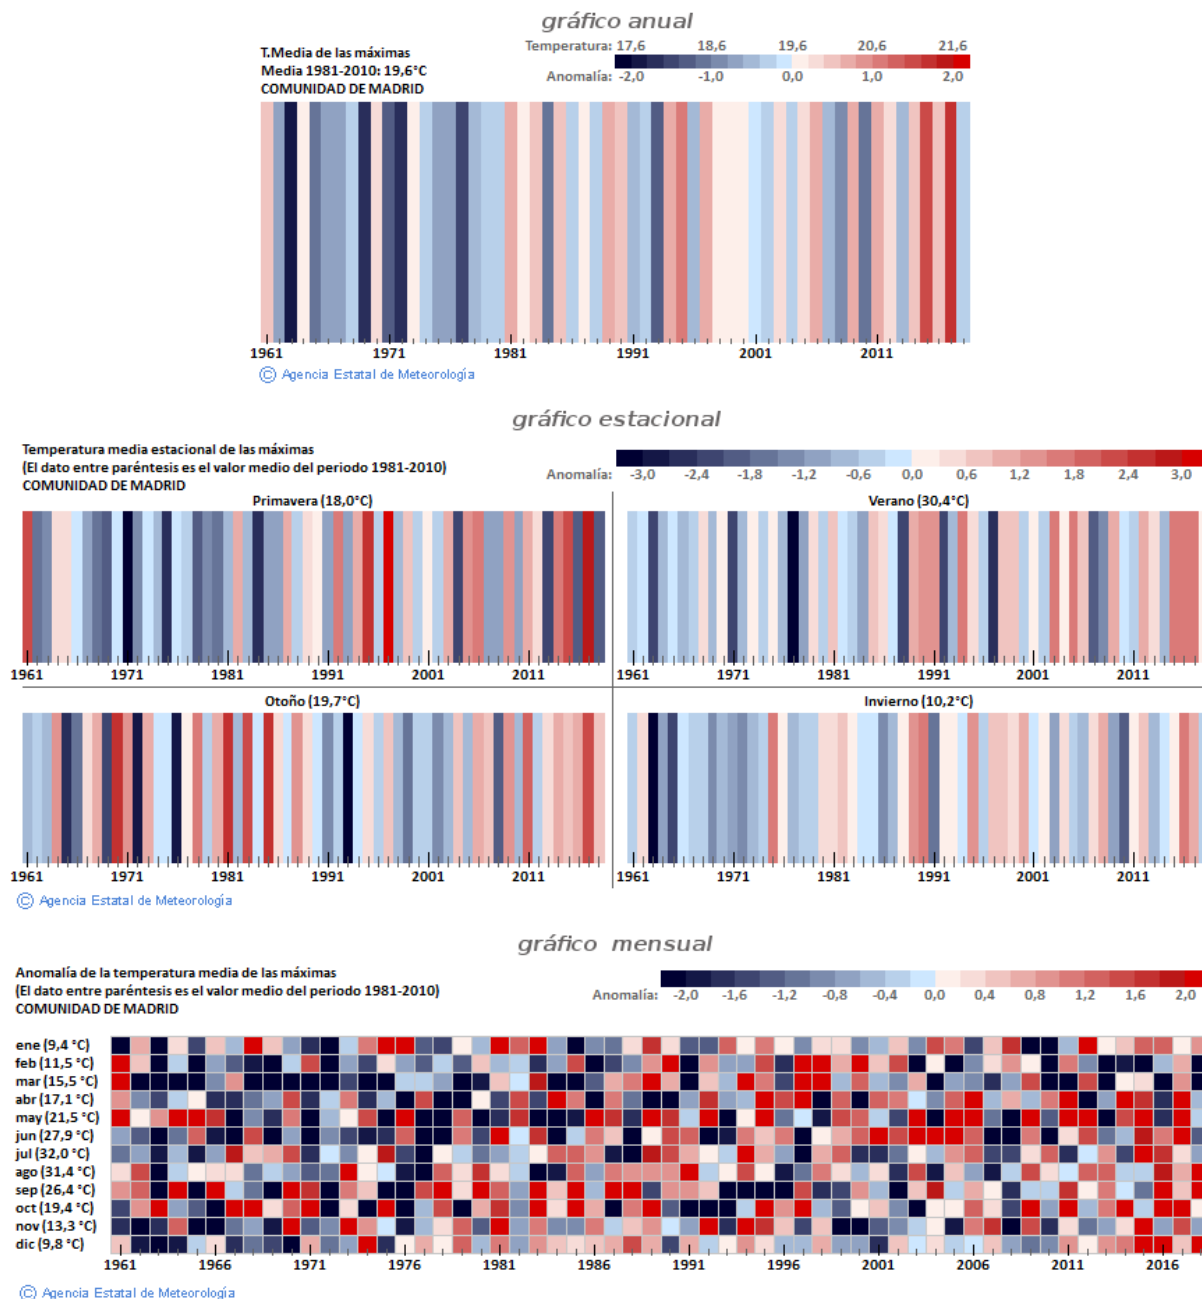

Figura E.38: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la Comunidad de Madrid.

## Temperatura media de las mínimas

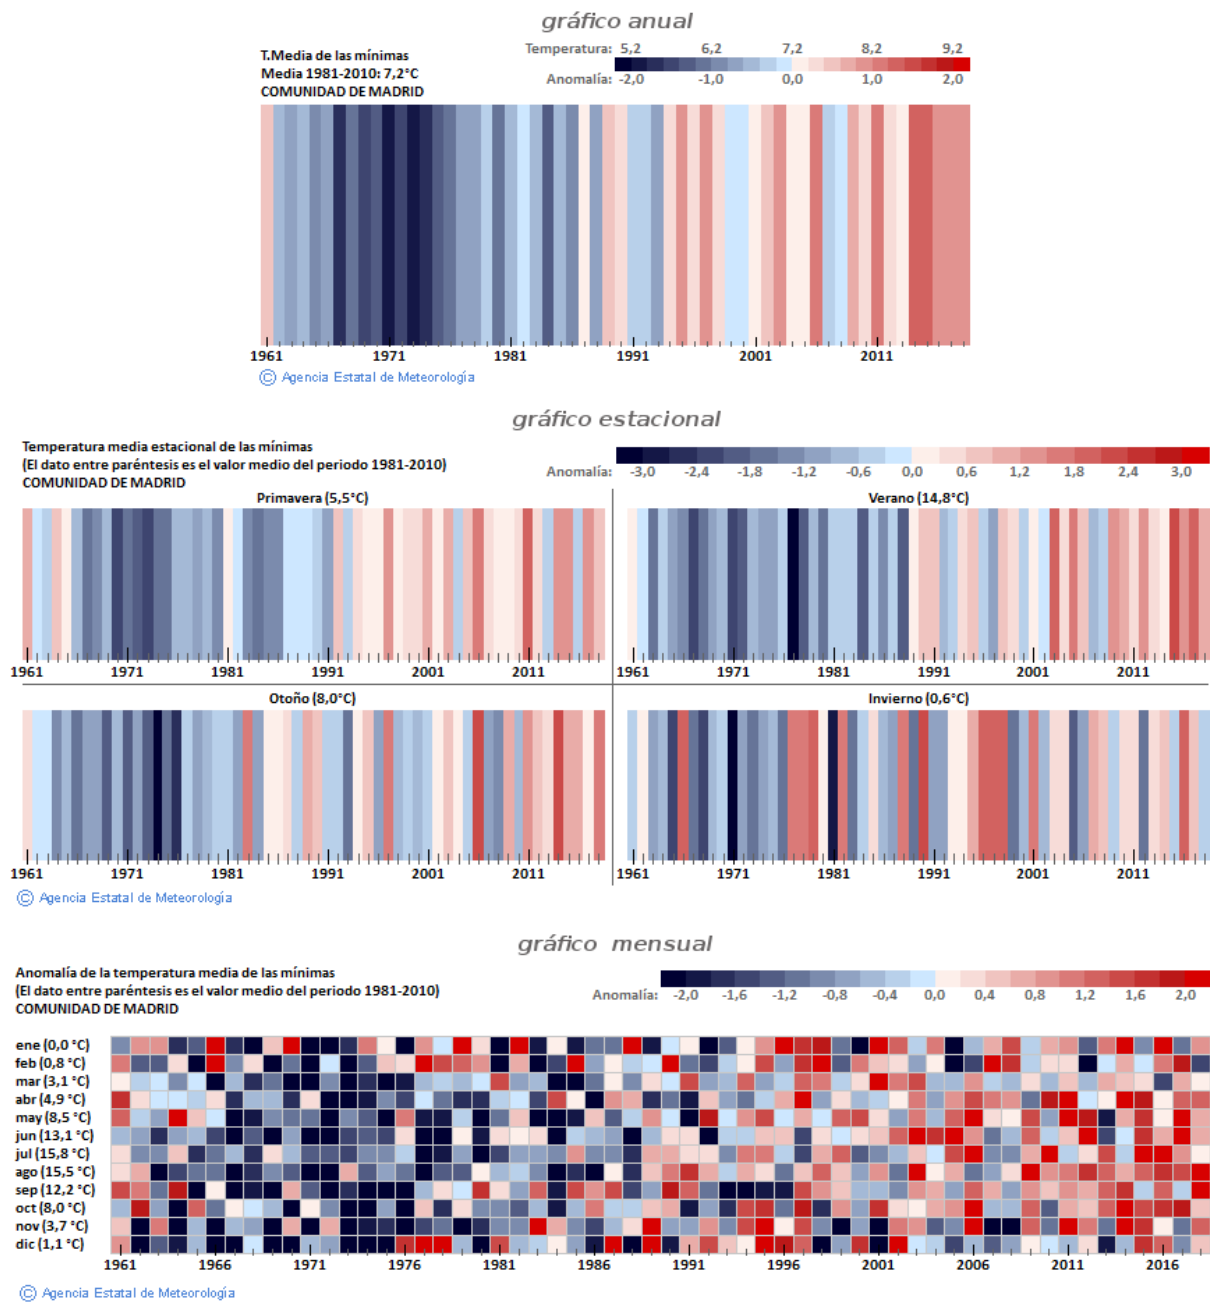

Figura E.39: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la Comunidad de Madrid.

## E.14 Región de Murcia

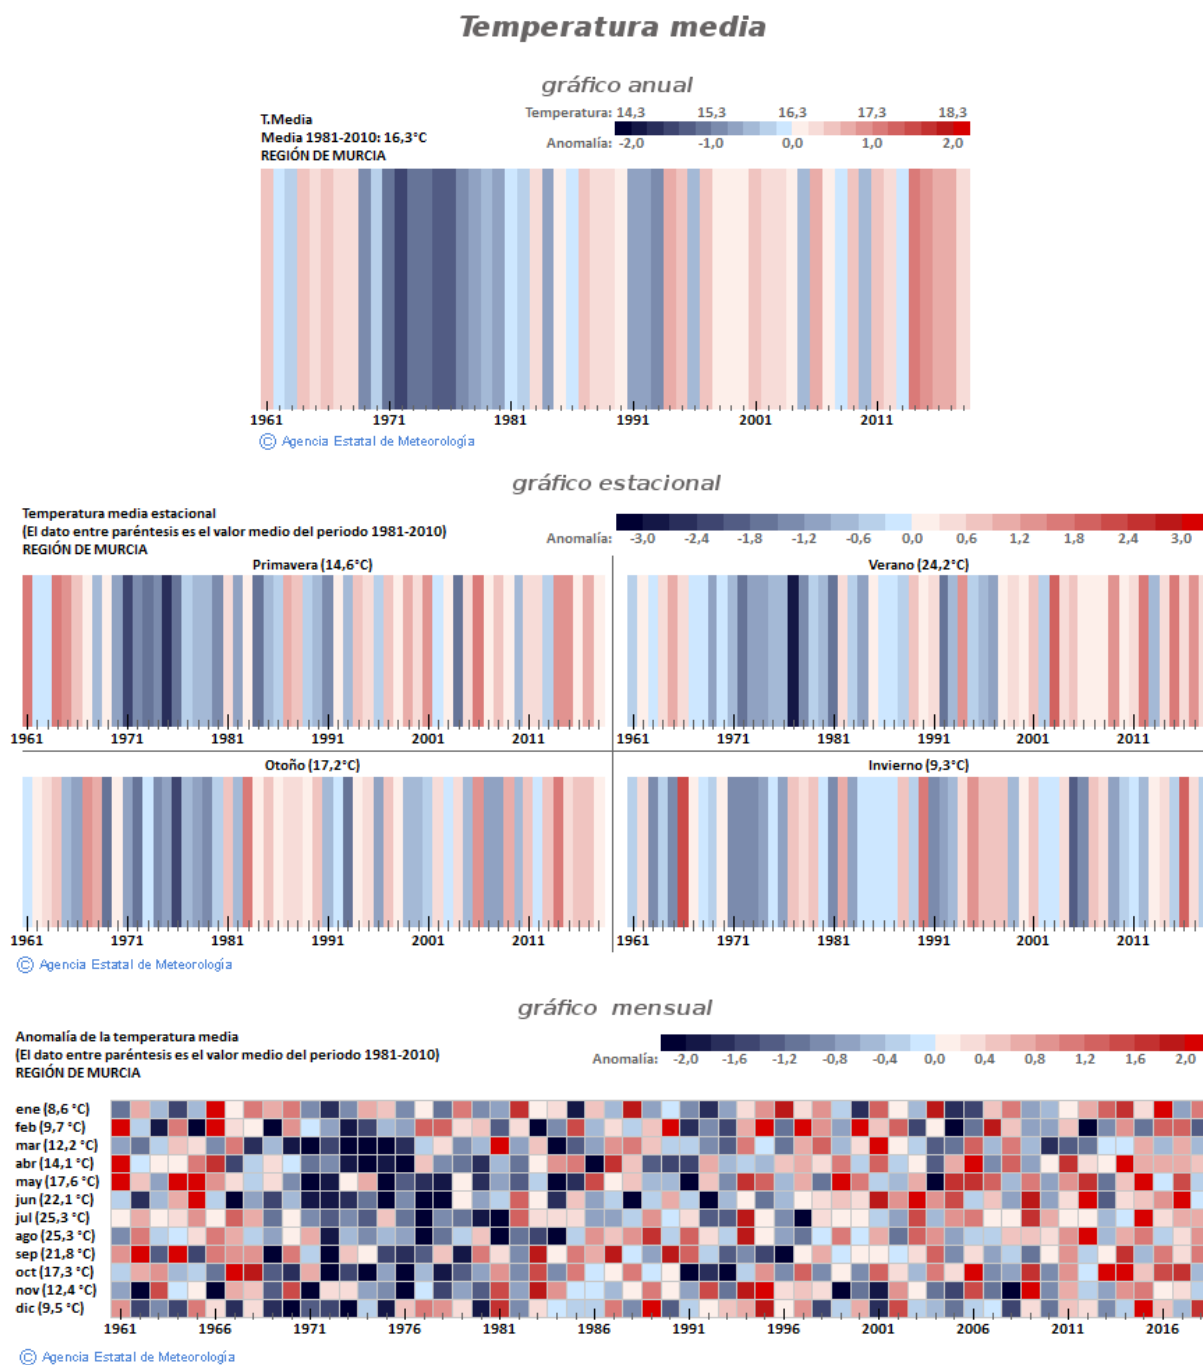

Figura E.40: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la Región de Murcia.

## Temperatura media de las máximas

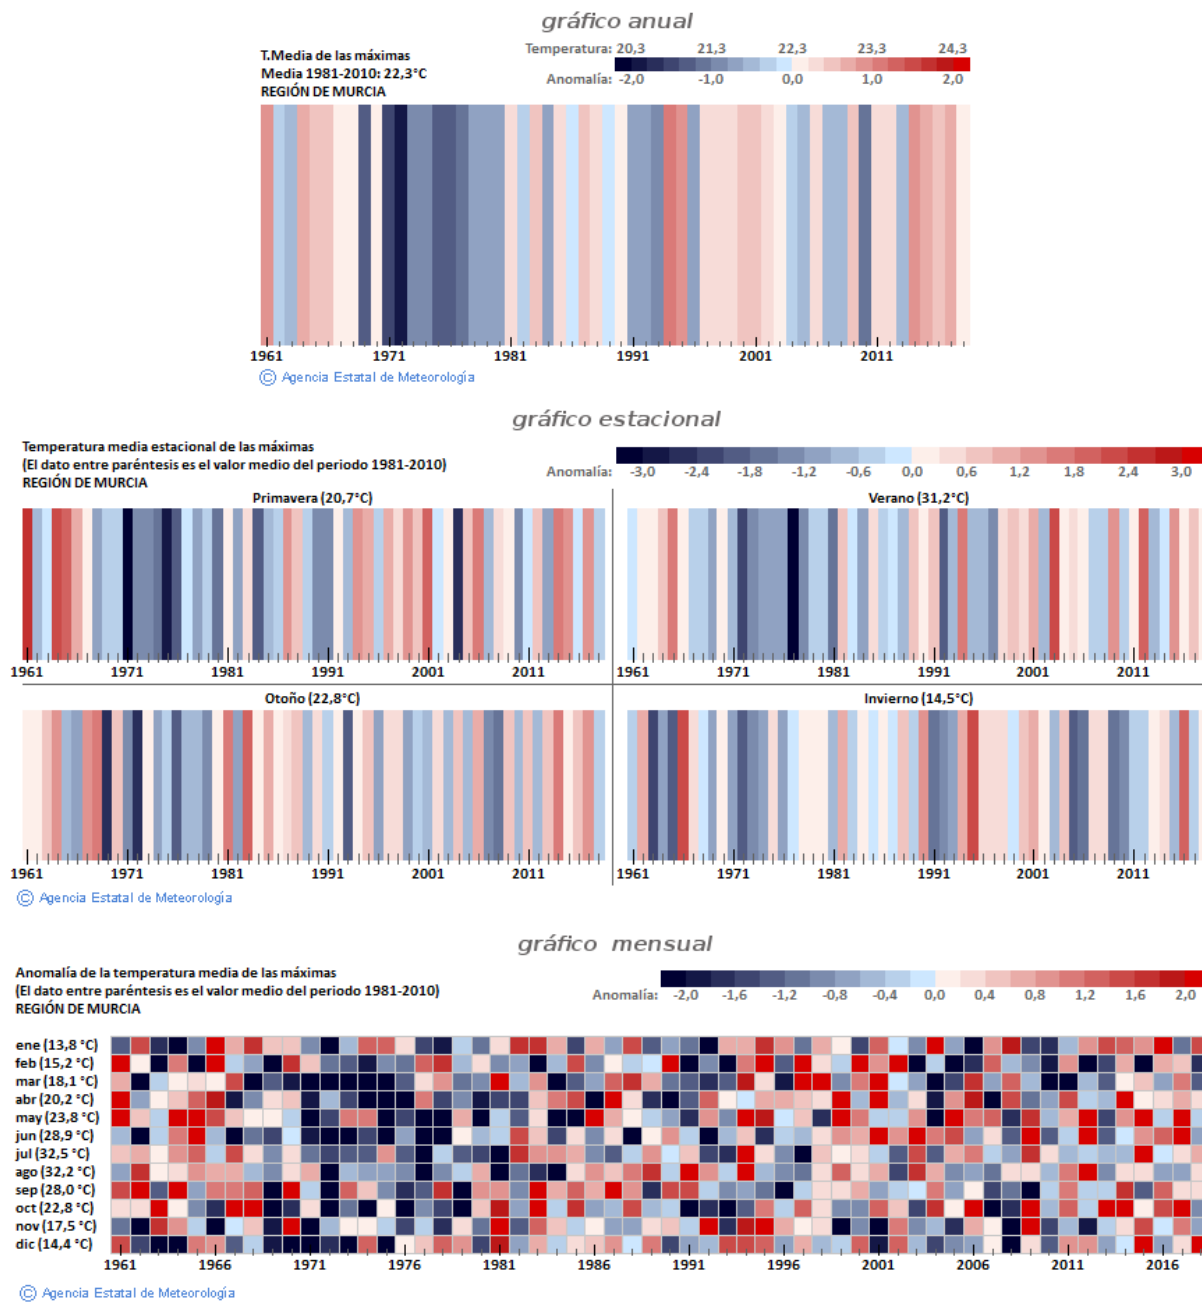

Figura E.41: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la Región de Murcia.

## Temperatura media de las mínimas

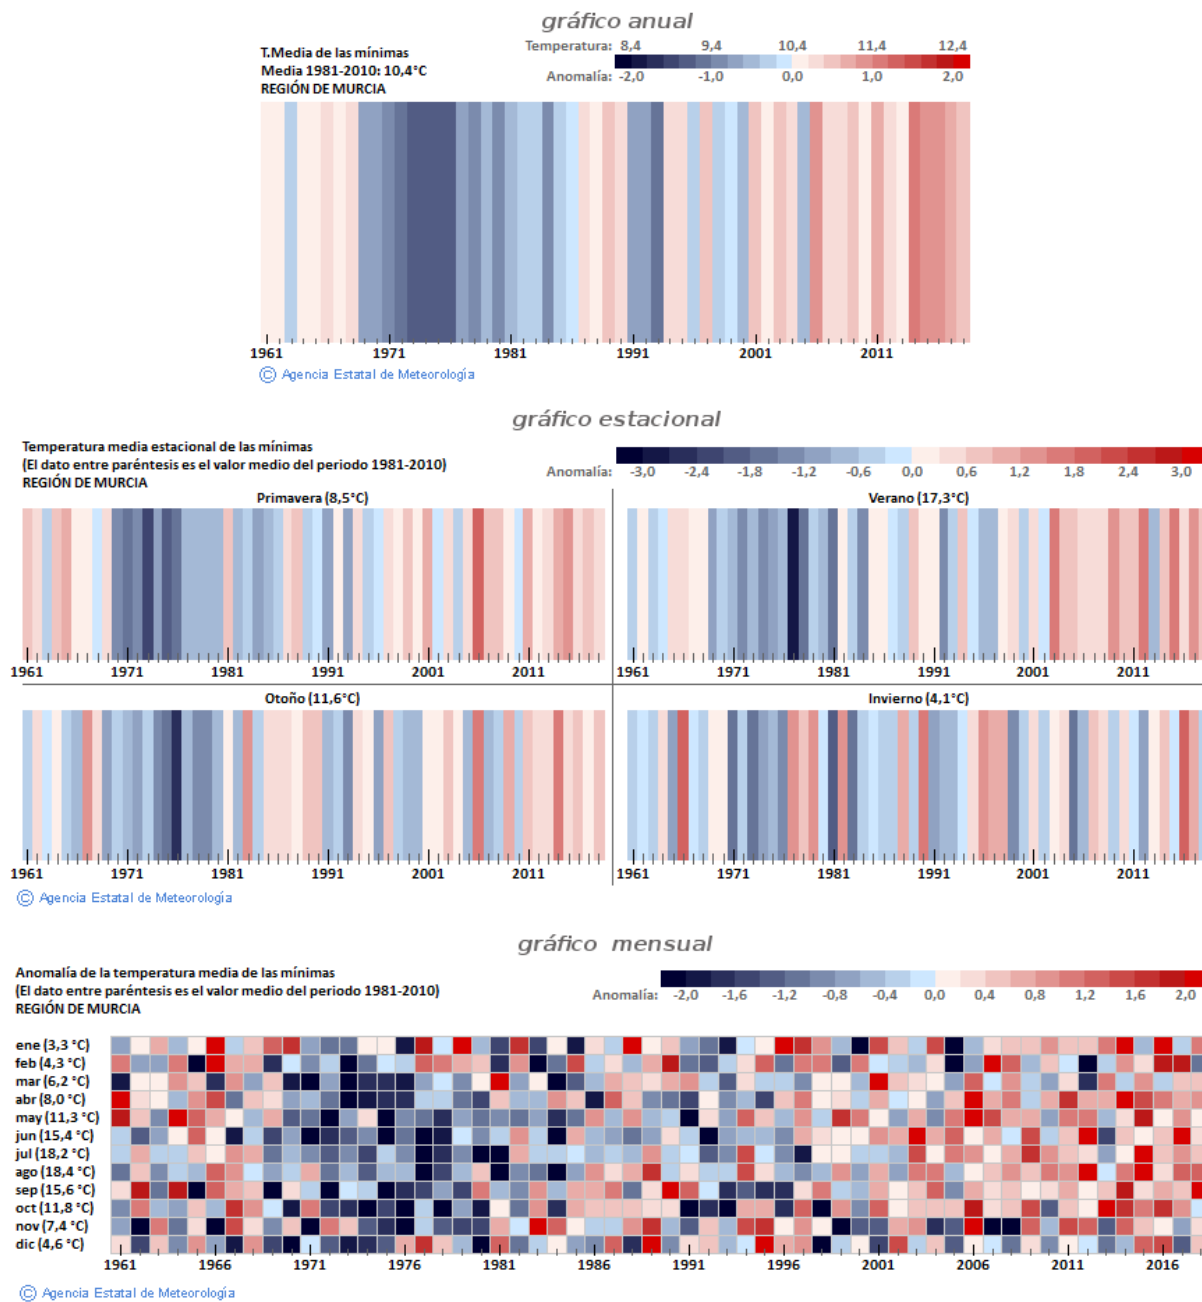

Figura E.42: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la Región de Murcia.

## E.15 Comunidad Foral de Navarra

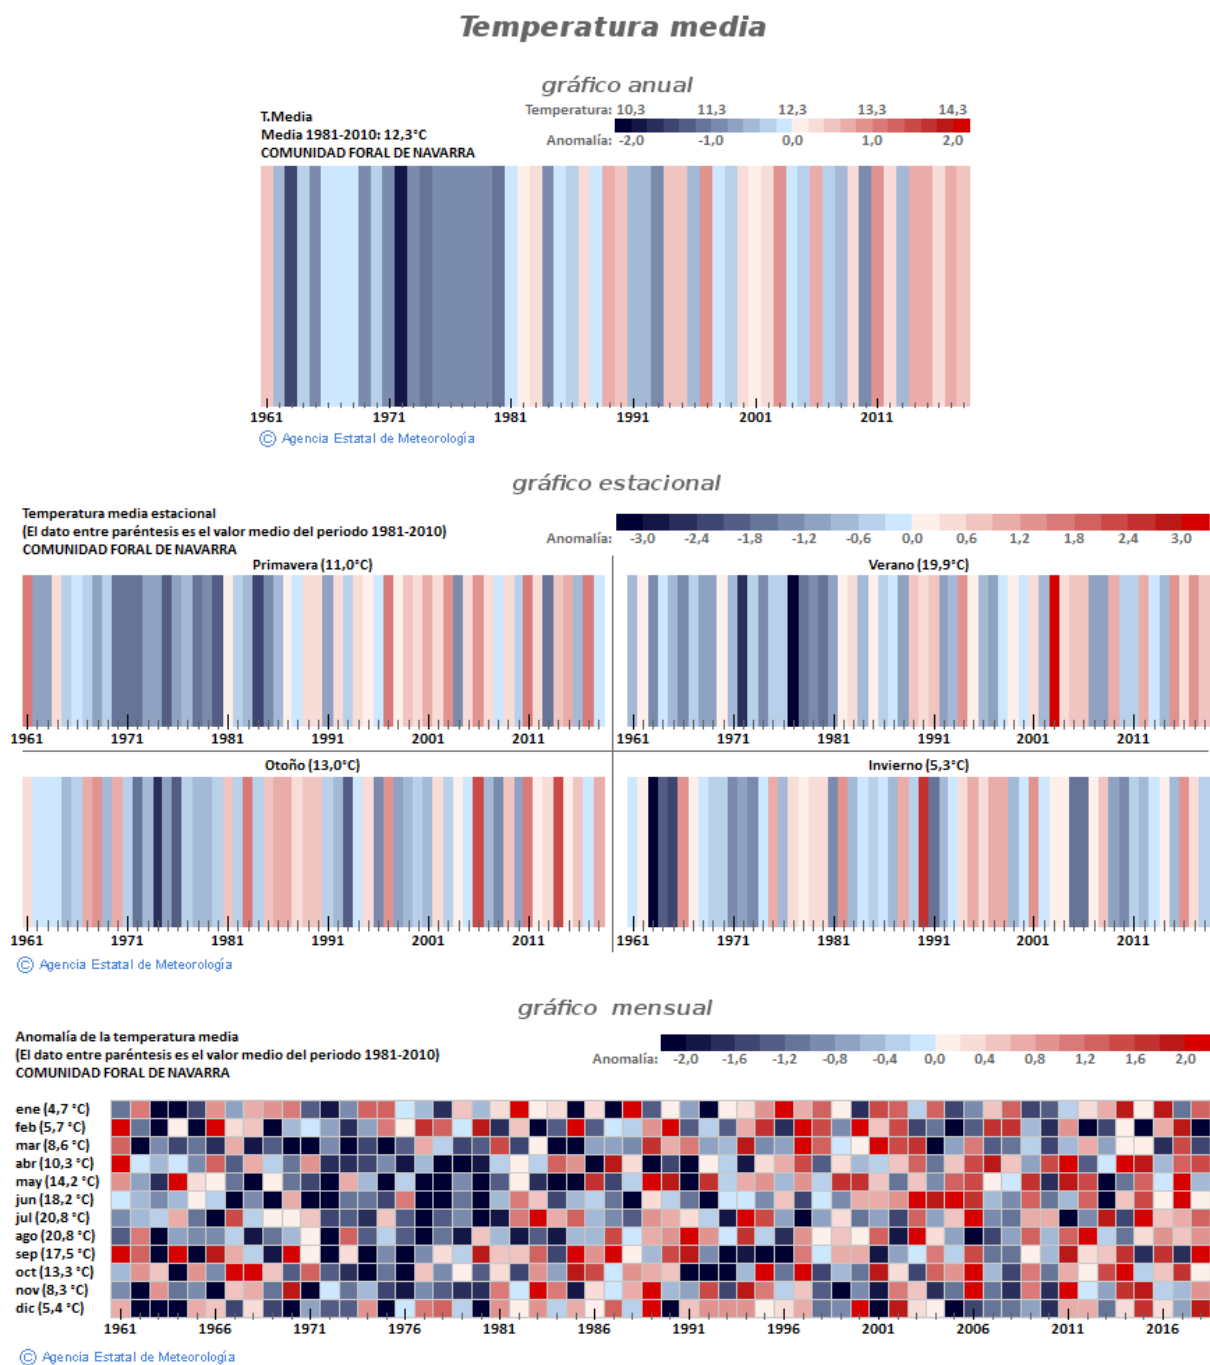

Figura E.43: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la Comunidad Foral de Navarra.

## Temperatura media de las máximas

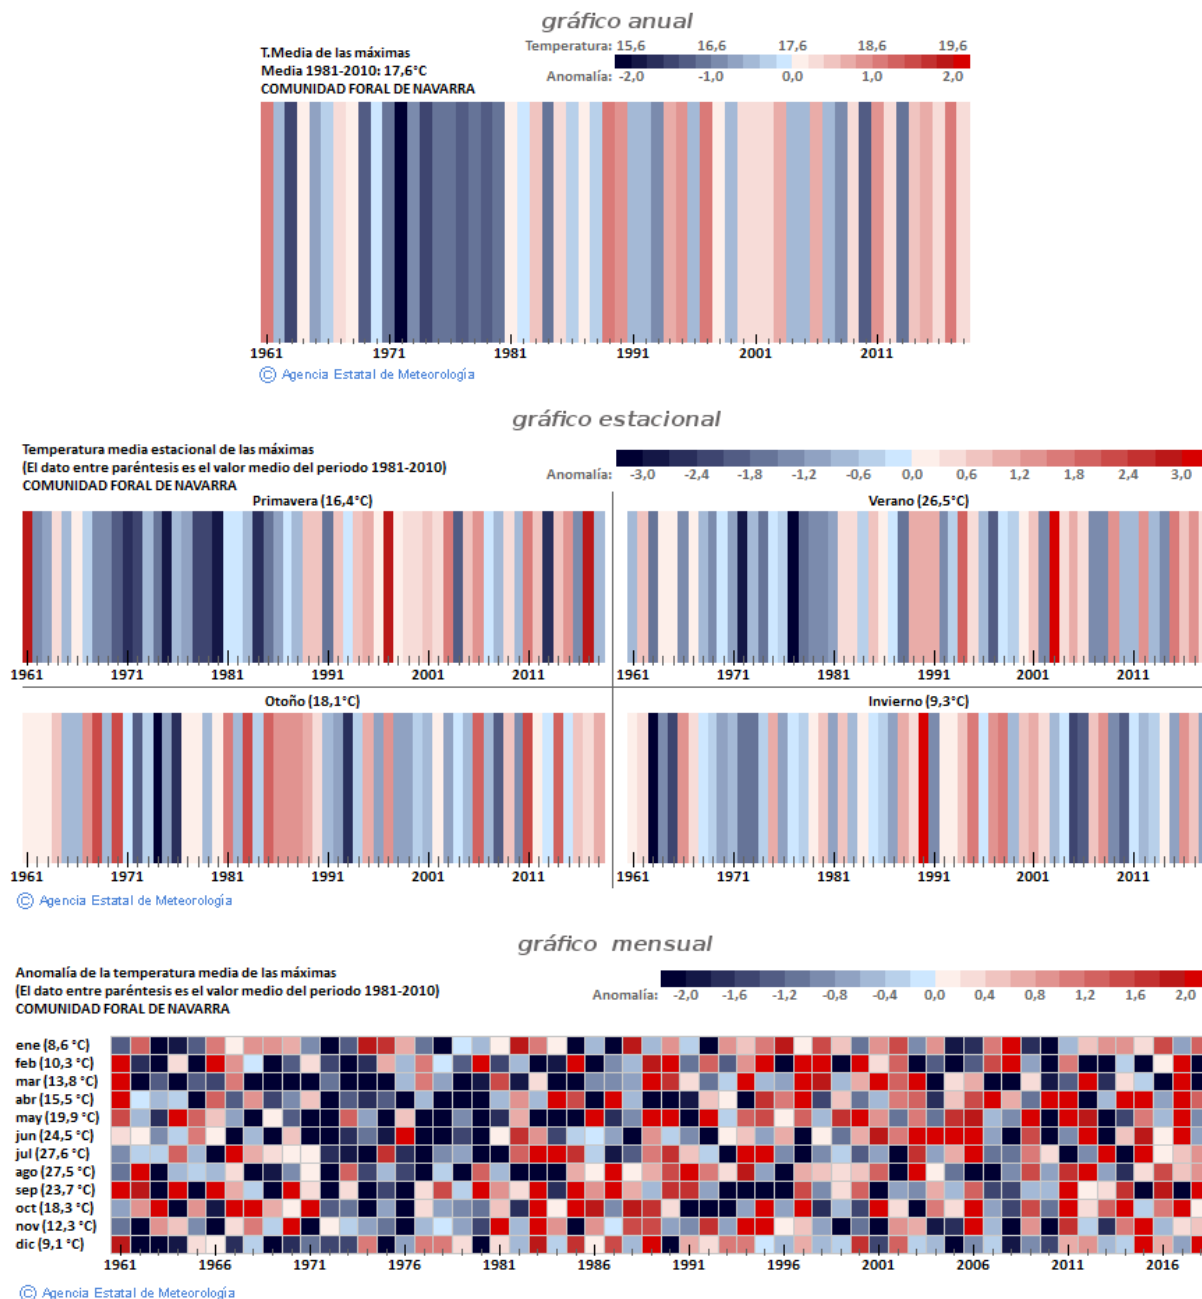

Figura E.44: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la Comunidad Foral de Navarra.

## Temperatura media de las mínimas

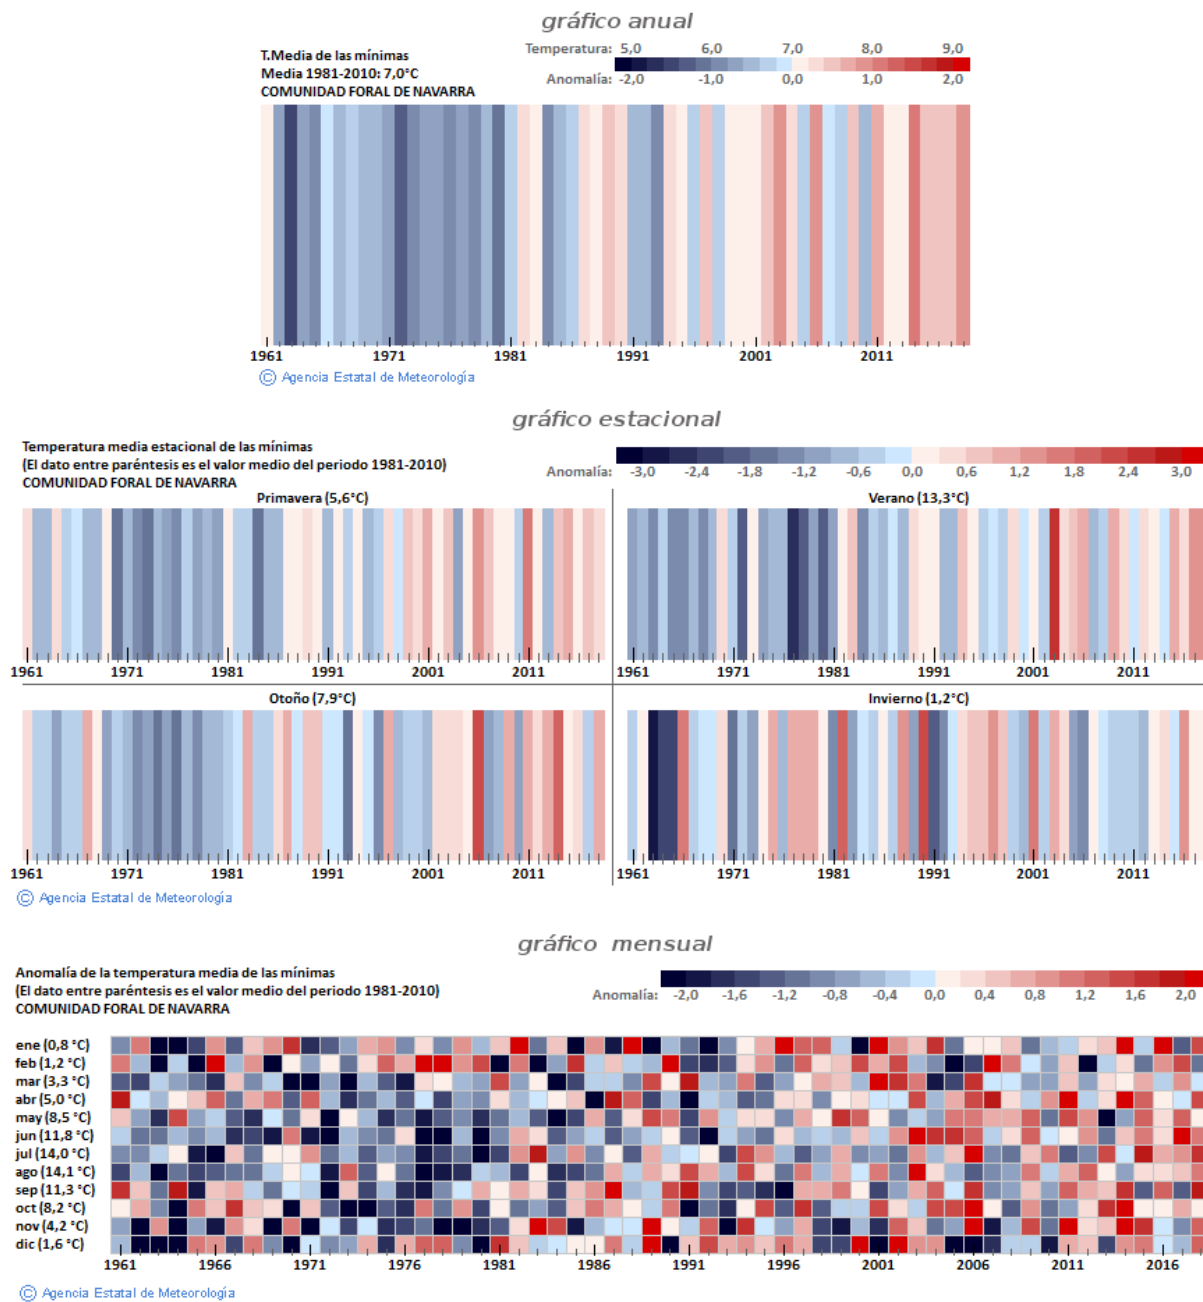

Figura E.45: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la Comunidad Foral de Navarra.

## E.16 País Vasco

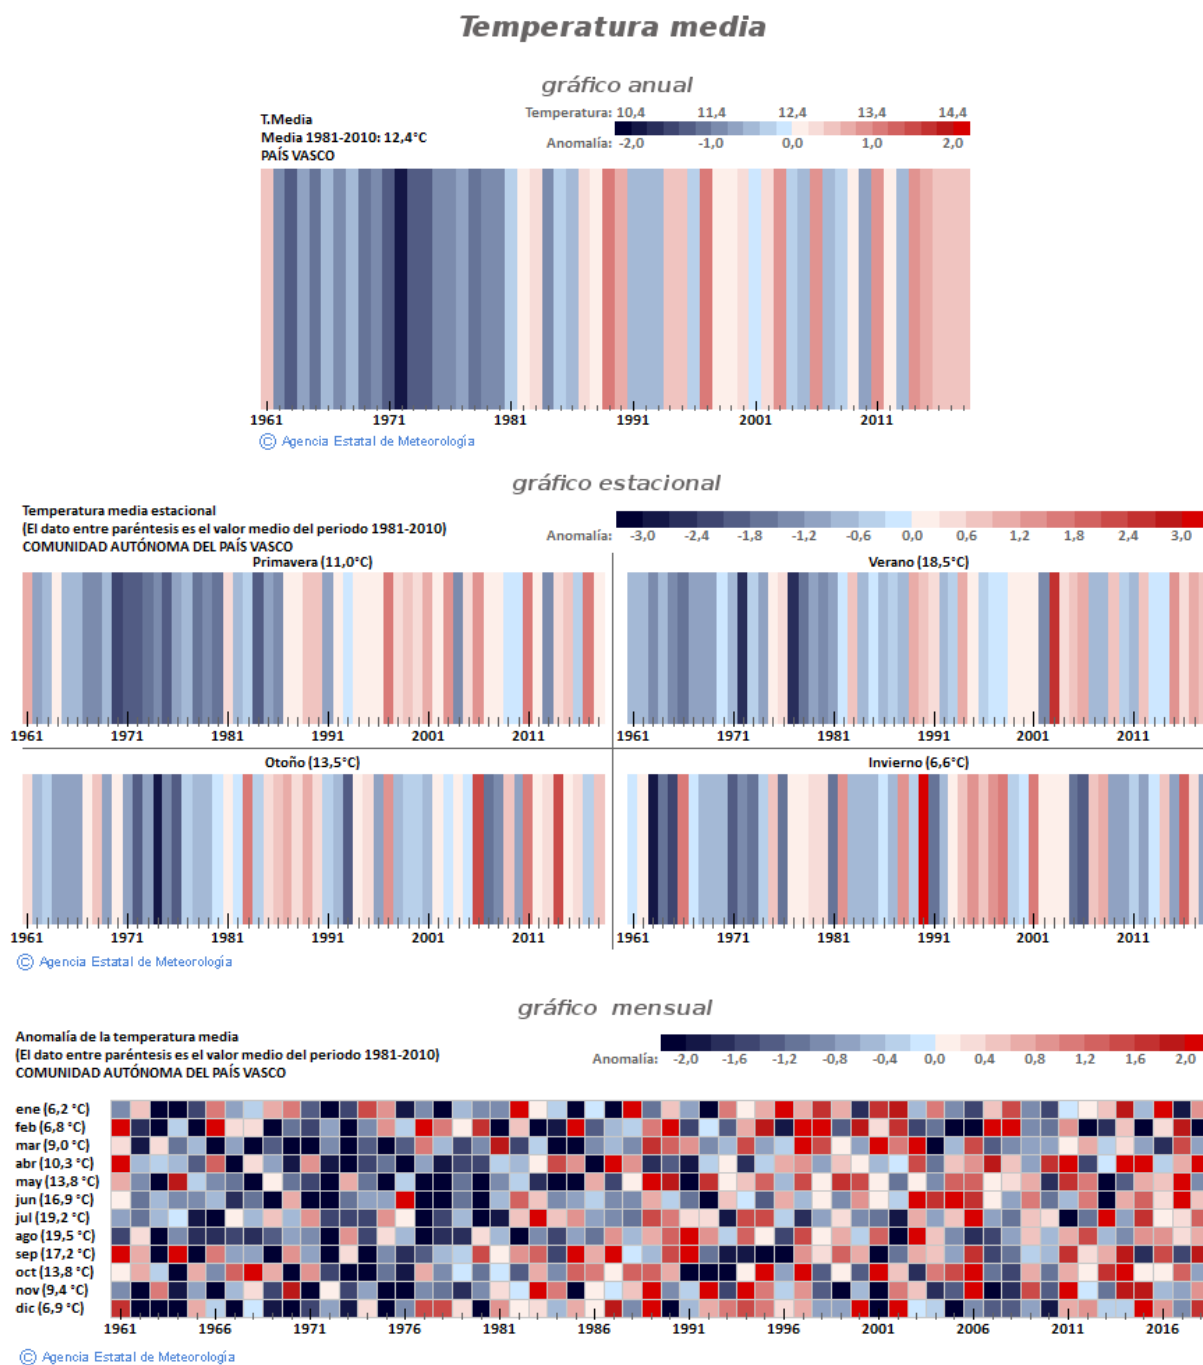

Figura E.46: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) del País Vasco.

## Temperatura media de las máximas

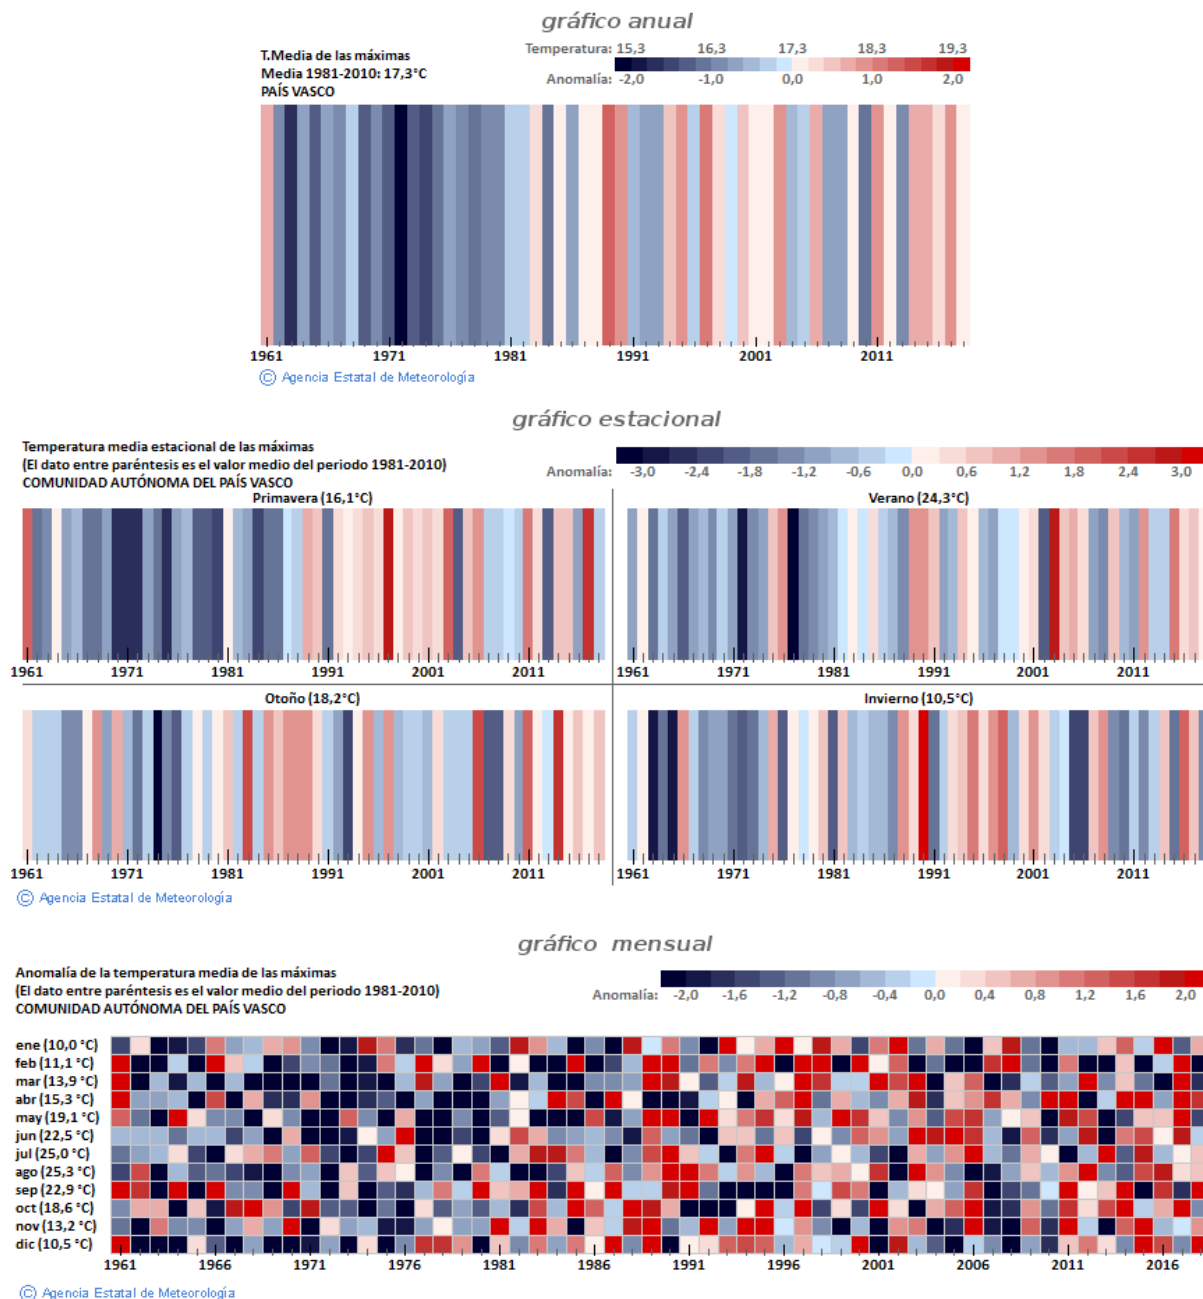

Figura E.47: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) del País Vasco.

## Temperatura media de las mínimas

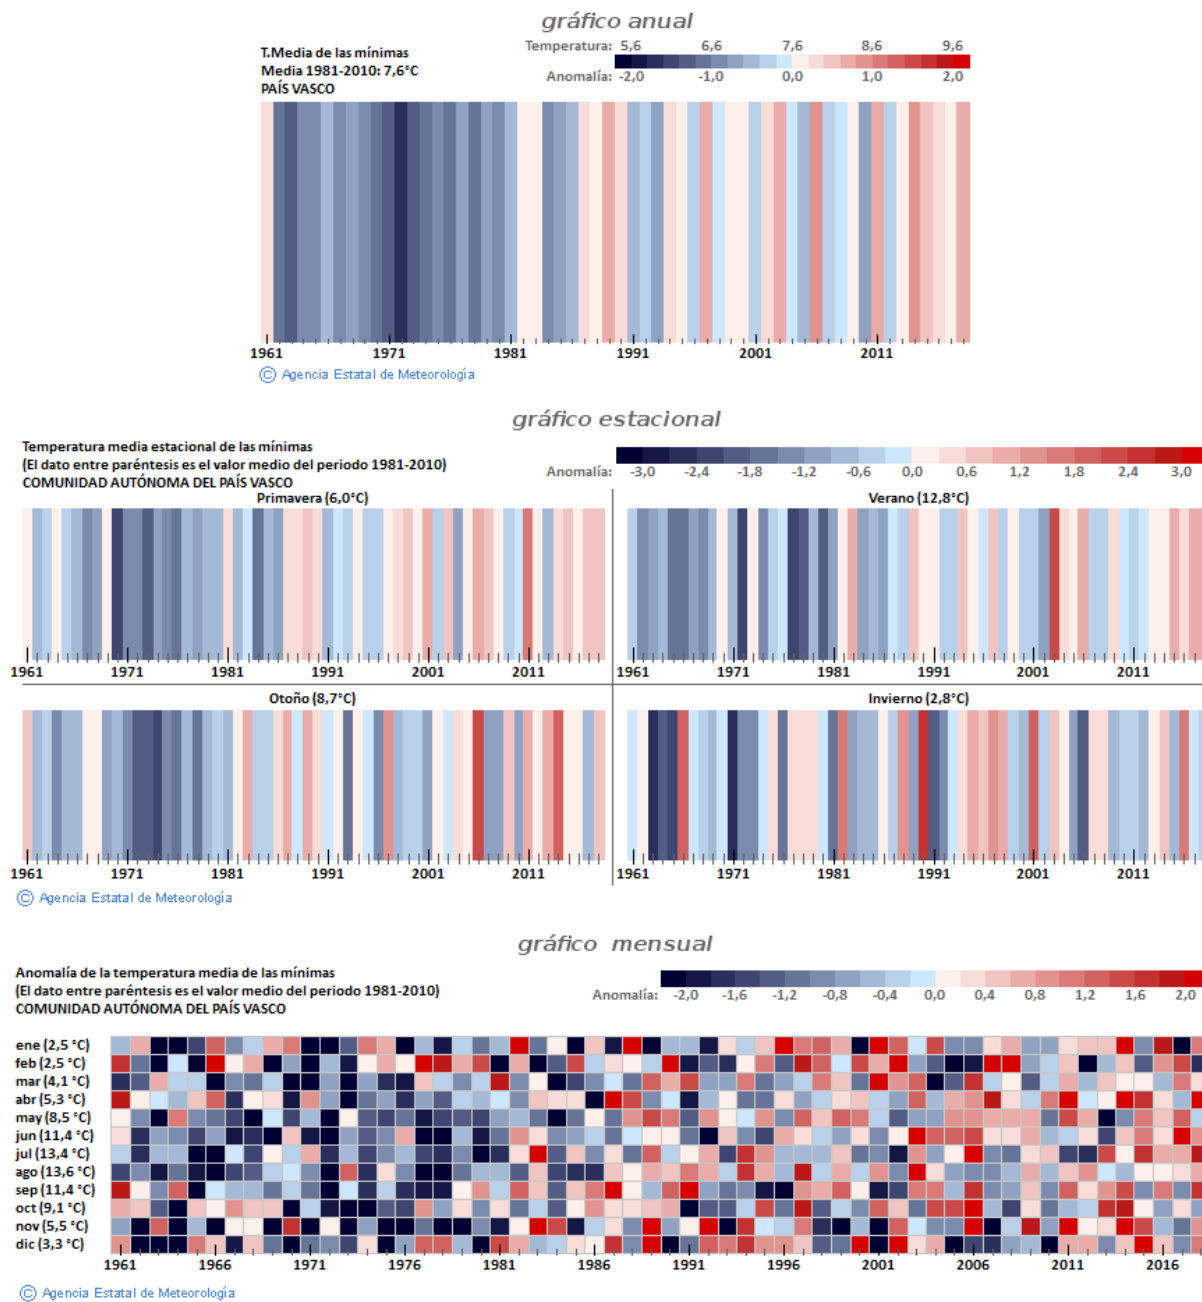

Figura E.48: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) del País Vasco.

## E.17 La Rioja

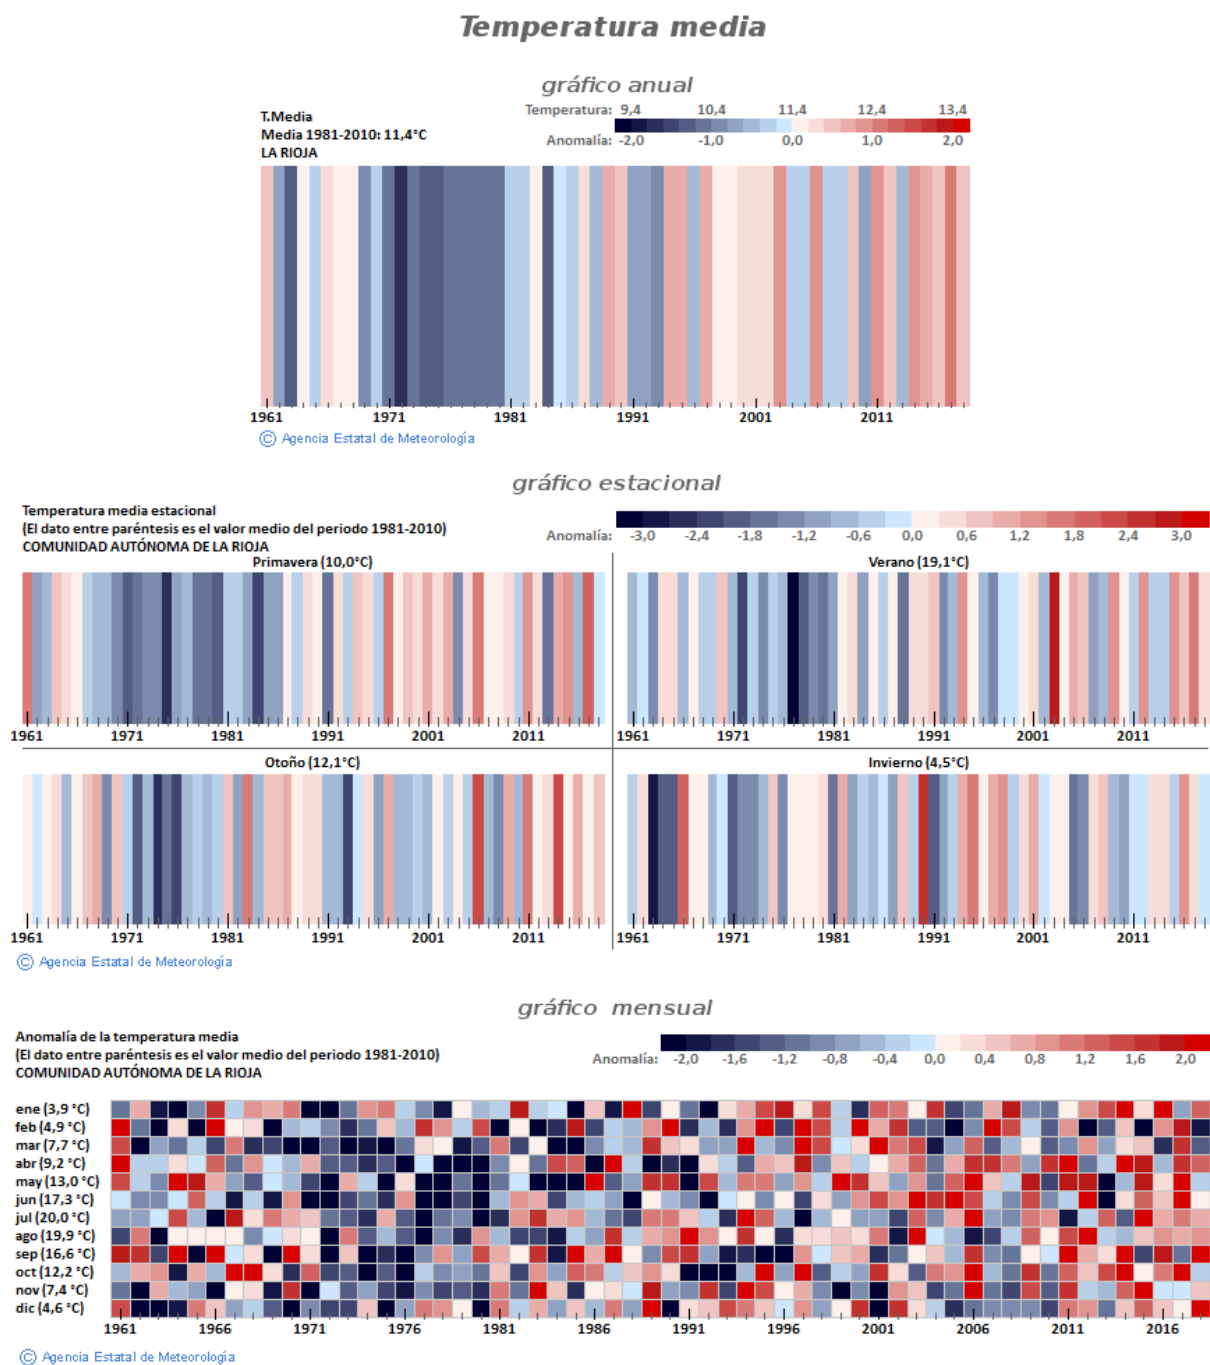

Figura E.49: Gráficos de barras de anomalías de la temperatura media anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de La Rioja.

## Temperatura media de las máximas

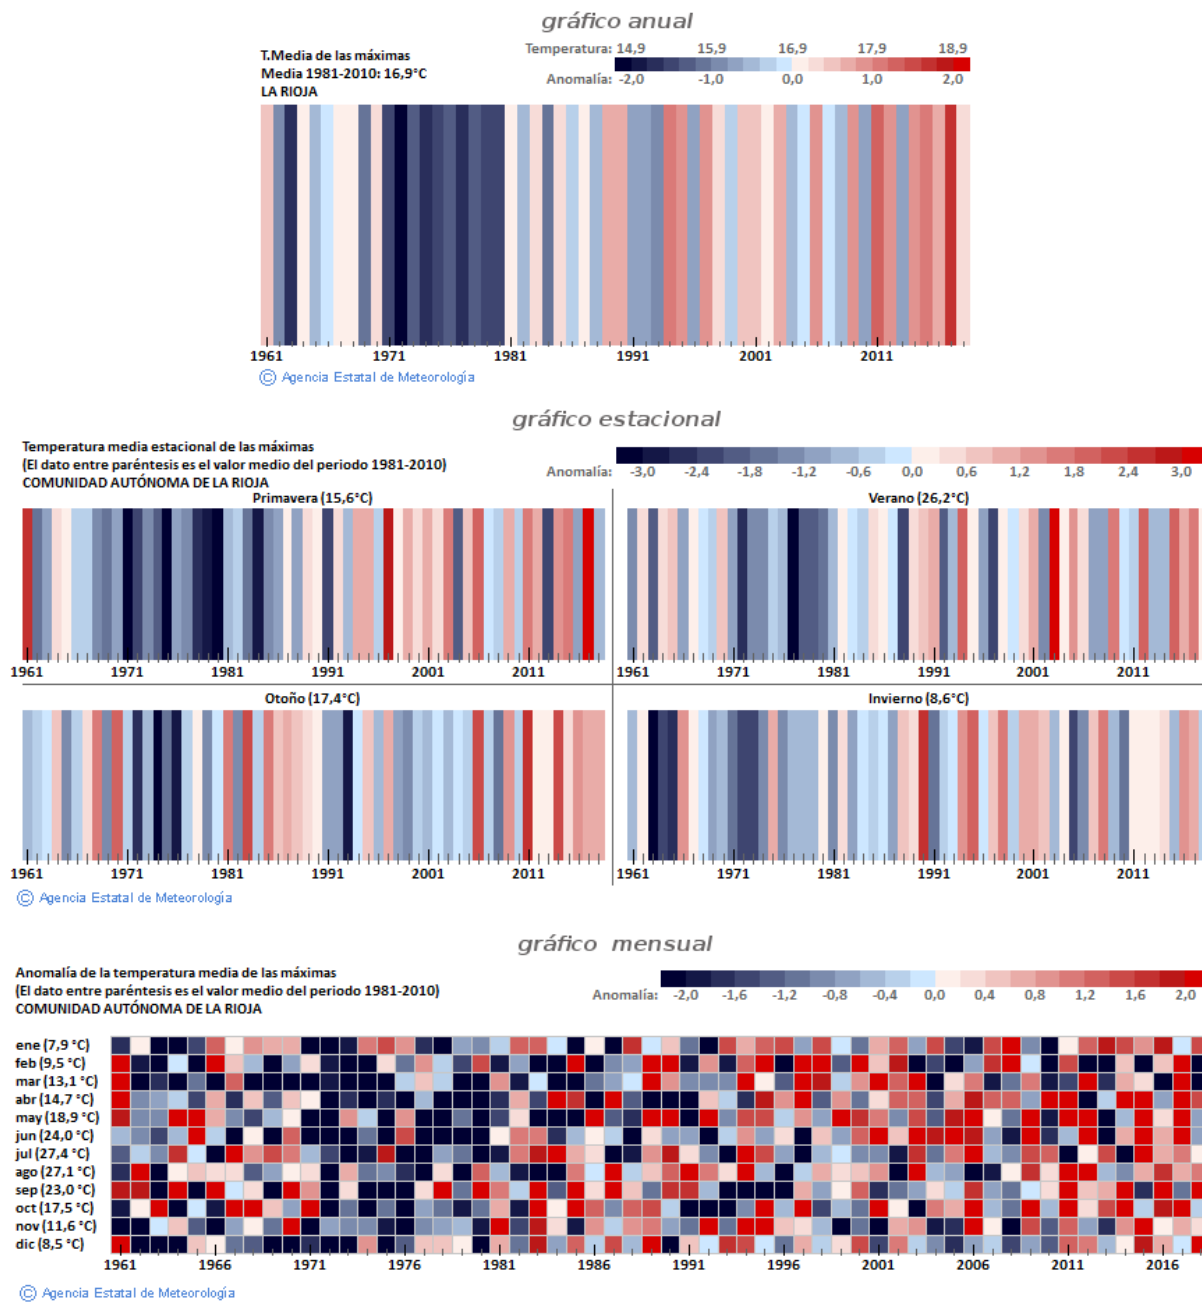

Figura E.50: Gráficos de barras de anomalías de la temperatura media de las máximas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de La Rioja.

## Temperatura media de las mínimas

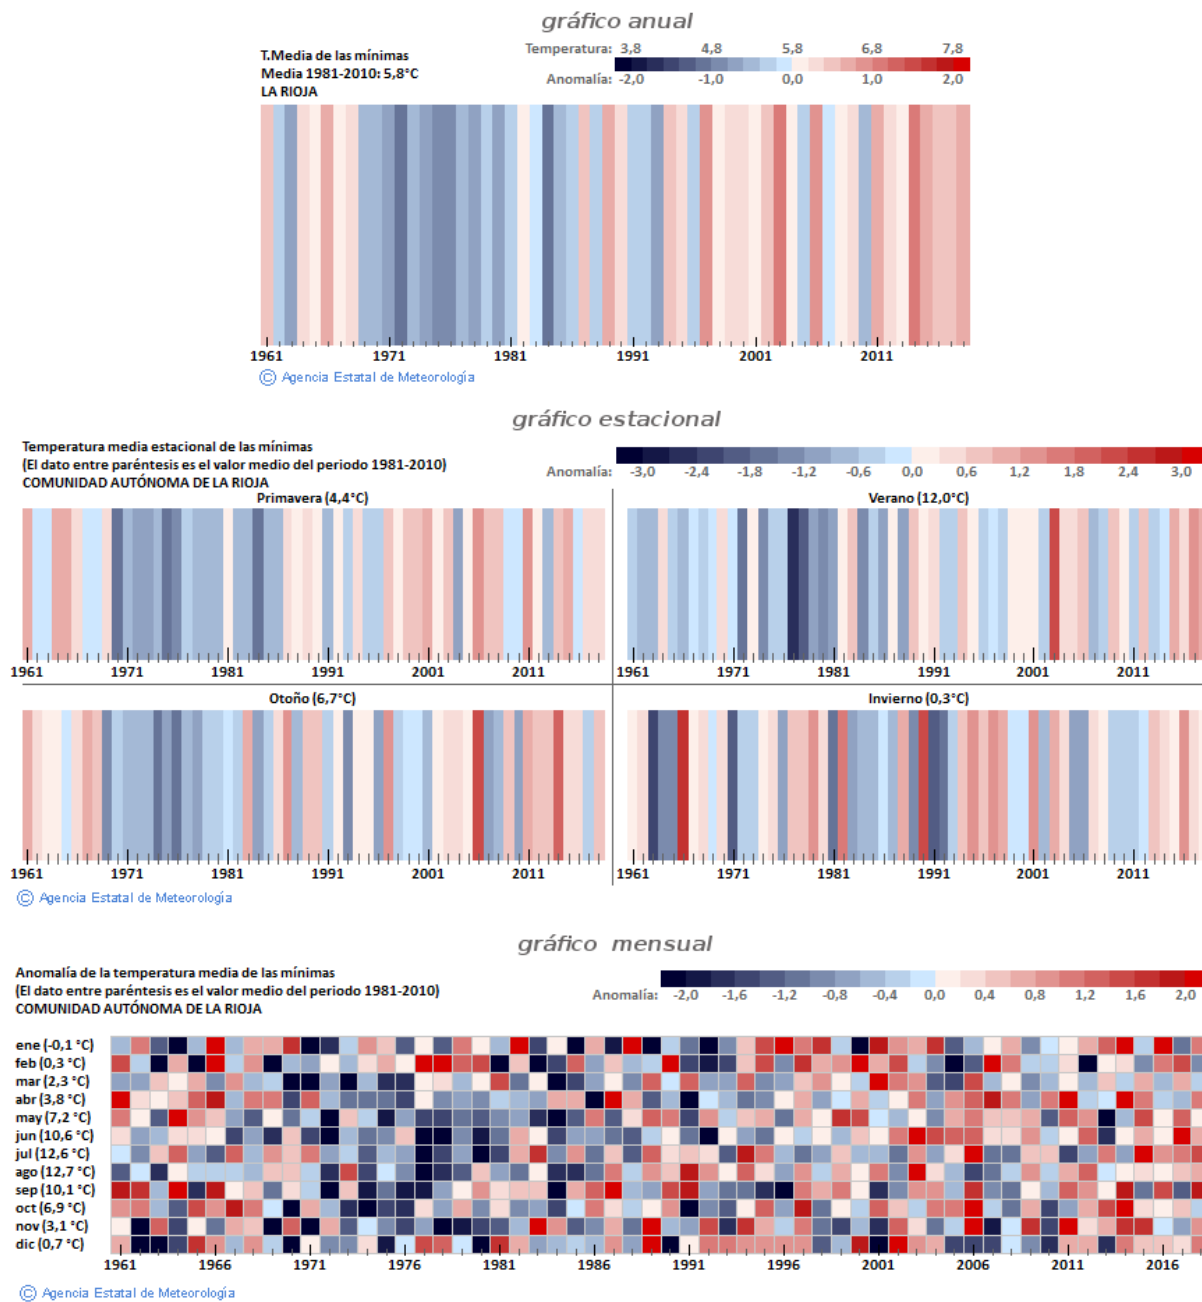

Figura E.51: Gráficos de barras de anomalías de la temperatura media de las mínimas anual (arriba), estacional (centro) y mensual (abajo) de la comunidad autónoma de La Rioja.
